Water Exchange in Two-Layer Stratified Waters,
W74-05736 2L

ROYAL VETERINARY AND AGRICULTURAL COLL., COPENHAGEN (DENMARK). HYDROTECHNICAL LAB.
Gamma Radiation for Measuring Water Contents in Soil Columns with Changing Bulk Density,
W74-05930 2G

RUTGERS-THE STATE UNIV., NEW BRUNSWICK, N.J. DEPT. OF GEOGRAPHY.
A Factor Analysis of Selected Water Quality Variables in Central New Jersey During 1960-1969,
W74-05716 5B

SCRIPPS INSTITUTION OF OCEANOGRAPHY, LA JOLLA, CALIF.
Human Ecology and Coastal-Zone Pollution,
W74-05597 5G

SEKI HIGH SCHOOL (JAPAN).
Fish Fauna in River Nagaragawa and Its Change for the Last Several Years in Relation to River Pollution (In Japanese),
W74-05580 5C

SINGAPORE UNIV.
Soil Moisture Under Forest, Bukit Timah Nature Reserve, Singapore,
W74-05947 2G

SKIDAWAY INST. OF OCEANOGRAPHY, SAVANNAH, GA.
Transport, Fate and Geochemical Interactions of Mercury, Cadmium and other Inorganic Pollutants in the Coastal Littoral-Salt Marsh Environment of the Southeastern United States.
W74-05501 5B

Heavy Metal Fluxes Through Salt Marsh Estuaries,
W74-05502 5B

An Improved Ion-Exchange Technique for the Concentration of Manganese From Sea Water,
W74-05506 5A

SOIL CONSERVATION SERVICE, PORTLAND, OREG.
Flood Hazard Analyses, Sand Creek, City of Colorado Springs, and El Paso County.
W74-05860 2E

SOIL CONSERVATION SERVICE, STILLWATER, OKLA.
Erosion Control,
W74-05741 2J

SOIL CONSERVATION SERVICE, WASHINGTON, D.C.
Little Running Water Ditch Watershed Protection, Flood Prevention, and Land Drainage RC and D Measure Plan (Final Environmental Statement).
W74-05806 4D

SOUTH DAKOTA STATE UNIV., BROOKINGS. DEPT. OF PLANT SCIENCE.
Water-Leachable Nutrients from Frozen or Dried Prairie Vegetation,
W74-05696 5B

SOUTHERN PIEDMONT CONSERVATION RESEARCH CENTER, WATKINSVILLE, GA.
A Survey of Stomatal Movements and Associated Potassium Fluxes in the Plant Kingdom,
W74-05769 2I

SOUTHWESTERN PENNSYLVANIA REGIONAL PLANNING COMMISSION, PITTSBURGH.
Scape: A Computer Model for Alternative Sewer System Cost Evaluation,
W74-05873 5D

STABILIZATION CHEMICALS, ANAHEIM, CALIF. (ASSIGNEE)
Shoreline Construction for Artificial Water Bodies,
W74-05882 8A

STATE UNIV. OF NEW YORK, BUFFALO. DEPT. OF CHEMISTRY.
Ring-Disk Electrode Study of the Anodic Behavior of Gold in 0.2M Sulfuric Acid,
W74-05446 2K

SUN OIL CO., DALLAS, TEX.
Modeling the Regulation of Lake Superior Under Uncertainty of Future Water Supplies,
W74-05938 4A

SYRACUSE UNIV., N.Y. COLL. OF LAW.
International Impact Reports and the Conservation of the Ocean Environment,
W74-05781 5G

SYRACUSE UNIV., N.Y. DEPT. OF CIVIL ENGINEERING.
Benefit-Related Expenditures for Industrial Waste Treatment,
W74-05641 5D

SYSTEMS CONTROL, INC., PALO ALTO, CALIF.
Extended Period Simulation of Water Distribution Networks,
W74-05533 4A

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF AGRICULTURAL ECONOMICS AND RURAL SOCIOLOGY.
An Economic Analysis of Alternative Sprinkler Irrigation Distribution Systems on the Southern High Plains of Texas,
W74-05924 3F

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF BIOLOGY.
The Occurrence and Distribution of the Hydroids of the Galveston Bay, Texas, Area,
W74-05529 2L

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF OCEANOGRAPHY.
Biological Studies on the Fresh-Water Shrimps in Korea: 4. The Ecology of Macrobrachium nipponensis (De Haan) (In Korean),
W74-05583 2I

TEXAS UNIV., HOUSTON. SCHOOL OF PUBLIC HEALTH.
Trend Sulface Analysis and Seasonal Distribution Patterns of Primary Nutrients and Chlorophyll in Unstratified Gulf Coast Estuaries,
W74-05488 5B

THOMAS J. WATSON RESEARCH CENTER, YORKTOWN HEIGHTS, N.Y.
Optimal Design and Operation of Water Distribution Systems,
W74-05937 4A

TORONTO UNIV. (ONTARIO). DEPT. OF MECHANICAL ENGINEERING.
Bubbly Two-Phase Flow in Hydraulic Jump,
W74-05831 8B

TRANSPORT AND ROAD RESEARCH LAB., CROWTHORNE (ENGLAND).
The Estimation of Flood Flows from Natural Catchments,
W74-05850 4A

UNILEVER LTD., PORT SUNLIGHT (ENGLAND). UNILEVER RESEARCH LAB.
Surfactant-Selective Electrodes. Part I. An Improved Liquid Ion-Exchanger,
W74-05474 5A

UNITED AIRCRAFT CORP., EAST HARTFORD, CONN.
Vortex Oil-Water Separator System Providing Clean Water,
W74-05893 5G

Vortex Oil-Water Separator System Providing Clean Water,
W74-05894 5G

UNIVERSITY OF SOUTH FLORIDA, TAMPA. DEPT. OF STRUCTURES, MATERIALS, FLUIDS.
Two-Dimensional Analysis of Backwater at Bridges,
W74-05734 2E

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES.
Marine Studies of San Pedro Bay, California. Part I: Circulation Patterns in Los Angeles-Long Beach Harbor Drogue Study Atlas and Data Report,
W74-05708 2L

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES. ENVIRONMENTAL ENGINEERING PROGRAM.
Adsorption of Hg(II) by Hydrous Manganese Oxides,
W74-05491 5A

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES. OCEAN ENGINEERING PROGRAM.
Marina Del Rey: Computer Simulation of Pollutant Transport in Semi-Enclosed Water Body,
W74-05698 5B

UNIVERSITY OF STRATHCLYDE, GLASGOW (SCOTLAND). DEPT. OF FOOD SCIENCE.
Metaperiodate - A New Structure-Specific Locating Reagent for Phenolic Compounds,
W74-05439 5A

UNIVERSITY OF WESTERN ONTARIO, LONDON. DEPT. OF GEOLOGY.
International Management of the Rio Grande Basin - The United States and Mexico,
W74-05664 4A

UTAH WATER RESEARCH LAB., LOGAN.
Interregional Planning of Water Resources Allocations by Systems Analysis Approach,
W74-05932 4A

UTTAR PRADESH AGRICULTURAL UNIV., NAINI TAL (INDIA). DEPT. OF AGRICULTURAL ENGINEERING.
Shape Factors in Irrigation Water Advance Equation,
W74-05681 3F

VIRGINIA COMMONWEALTH UNIV., RICHMOND. DEPT. OF BIOLOGY.
Effects of Sedimentation of the Algal Flora of a Small Recreational Impoundment,
W74-05486 5C

VIRGINIA INST. OF MARINE SCIENCE, GLOUCESTER POINT.
Effectiveness of Sequential Photography for Coastal Oceanography,
W74-05711 2L

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF BIOLOGY.
Investigations of Freshwater Surface Microlayers,
W74-05410 5A

VIRGINIA UNIV., CHARLOTTESVILLE. DEPT. OF CHEMISTRY.
The Determination of Boron in Solution to Sub-p.p.b. Concentrations by Hollow-Cathode Emission,
W74-05468 5A

VOITH (J. M.) G.M.B.H., HEIDENHEIM (WEST GERMANY).
In-Plant Measures for Reduction of the Specific Freshwater Consumption of Paper Mills,
W74-05433 5D

VYSKUMNY USTAV PAPIERU A CELULOZY, BRATISLAVA (CZECHOSLOVAKIA).
Response of River Water to Biochemically Degradable Substances in Pulp Mill Waste Water (Odezva reky na biochemicky odbouratelne latky v odpadnich vodach z celulozek),
W74-05431 5B

WAGNER COLL. SCIENCE CENTER, STATEN ISLAND, N.Y.
Ultrasonic Solubilization Technique for Use in Coulometry,
W74-05497 5A

WAGNER COLL. SCIENCE CENTER, STATEN ISLAND, N.Y. DEPT. OF CHEMISTRY.
Determination of Potassium by Means of the Cotlove Chloridometer,
W74-05450 5A

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF ANIMAL SCIENCE.
A Model of a Nutritional Ecosystem to Conserve Nutrients for Man,
W74-05704 5B

WASHINGTON UNIV., SEATTLE. DEPT. OF OCEANOGRAPHY.
Hydrodynamical Stability of Salt Wedge,
W74-05825 2L

WASHINGTON UNIV., SEATTLE. DEPT. OF ZOOLOGY.
Species Introduction in a Tropical Lake,
W74-05492 5C

WASHINGTON UNIV., SEATTLE. DIV. OF MARINE RESOURCES.
The Land Water Interface in an Urban Region: A Spatial and Temporal Analysis of the Nature and Significances of Conflicts Between Coastal Uses,
W74-05872 6B

WATER RESOURCES BOARD, LONDON (ENGLAND). RESEARCH DIV.
Water Supply Problems and Future Resources,
W74-05864 6D

WATER RESOURCES COUNCIL, WASHINGTON, D. C.
75 Water Assessment. Draft Plan of Study.
W74-05626 6B

WATER TREATMENT CORP., CITY OF INDUSTRY, CALIF. (ASSIGNEE).
Method and Apparatus for Mixing Gases with Water,
W74-05907 5F

WESTERN AUSTRALIA UNIV., NEDLANDS. DEPT. OF SOIL SCIENCE AND PLANT NUTRITION.
Lateritic Deep Weathering of Granite,
W74-05929 2G

WESTERN WASHINGTON RESEARCH AND EXTENSION CENTER, PUYALLUP.
Metal Coordination Compounds of Thiabendazole,
W74-05490 5A

WESTINGHOUSE ELECTRIC CORP., PITTSBURGH, PA. (ASSIGNEE).
Waste and Water Treatment System,
W74-05905 5D

WICHITA STATE UNIV., KANSAS. DEPT. OF CHEMISTRY.
Gold Twin-Electrodes in Thin-Layer Electrochemistry,
W74-05475 2K

WINDSOR UNIV. (ONTARIO). DEPT. OF GEOLOGY.
Water Release from the Base of Active Glaciers,
W74-05728 2C

WISCONSIN STATE UNIV., OSHKOSH. DEPT. OF GEOGRAPHY.
Discharge Patterns in Two Crevasses of the Mississippi River Delta,
W74-05548 2L

WISCONSIN STATE UNIV., OSHKOSH. DEPT. OF GEOLOGY.
Groundwater Recharge with Treated Wastewater,
W74-05552 5D

WISCONSIN UNIV., KENOSHA. DEPT. OF GEOLOGY.
Proposal for a Particle-Size Grade Scale Based on 10,
W74-05719 2J

WISCONSIN UNIV., MADISON. DEPT. OF AGRICULTURAL ECONOMICS.
Aquaculture: Economic Feasibility in the Great Lakes Area,
W74-05648 6B

WISCONSIN UNIV., MADISON. DEPT. OF ECONOMICS; AND WISCONSIN UNIV., MADISON. DEPT. OF AGRICULTURAL ECONOMICS.
Economic Growth Vs. Environmental Protection: What Will be the Outcome,
W74-05644 6C

WISCONSIN UNIV., MADISON. DEPT. OF SOIL SCIENCE.
Nitrogen Transformations in Sediments as Affected by Chemical Amendments,
W74-05485 5B

Methane Formation by Lake Sediments During in Vitro Incubation,
W74-05487 5B

WISCONSIN UNIV., MADISON. INST. FOR ENVIRONMENTAL STUDIES.
Parkland Planning and Lake Management in the Rock River Basin.

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 12
JUNE 15, 1974

W74-05951 -- W74-06500

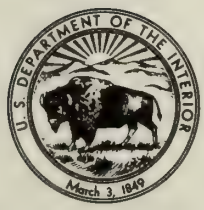
SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior



VOLUME 7, NUMBER 12
JUNE 15, 1974

W74-05951 – 274-06500

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR URBAN STUDIES IN THE DALLAS, TEXAS METROPOLITAN AREA, 1971,
Geological Survey, Austin, Tex.
B. C. Massey.
Data Report, 1973. 84 p, 4 fig, 3 tab, 6 ref.

Descriptors: *Urban hydrology, *Hydrologic data, *Texas, Urban runoff, Stream gages, Runoff, Rainfall-runoff relationships, Data collections, Precipitation(Atmospheric), Flood data.
Identifiers: *Dallas(Tex).

Hydrologic investigations of urban watersheds in Texas were begun by the U.S. Geological Survey in 1954. These studies are now in progress in Austin, Dallas, Dallas County, Fort Worth, Houston, and San Antonio. In August 1961, the Geological Survey in cooperation with the city of Dallas began a program of investigations designed to evaluate hydrologic factors affecting floods on several small streams in Dallas. The objectives of the Dallas area program are: to determine, on the basis of historical data and hydrologic analyses, the magnitude, frequency, and areal extent of flooding; to document and define floods of greater than ordinary magnitude; and to determine the effect of urban development on flood peaks and volume. The studies involve the collection of precipitation, runoff, and flood-evaluation data in seven drainage basins within the city of Dallas and in three drainage basins outside the city in Dallas County. Two of the seven study areas in Dallas have headwaters in rural areas outside the city limits, but the largest part of each drainage basin is within the city. (Knapp-USGS)

SENSITIVITY ANALYSIS OF A THUNDERSTORM RAINFALL MODEL,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
J. R. Wallace, and K.-L. L. Wang.
Available from the National Technical Information Service as PB-230 695; $4.00 in paper copy, $1.45 in microfiche. Environmental Resources Center, Georgia Institute of Technology, Atlanta, Report ERC-0374, January 1974, 73 p, 23 fig, 3 tab, 6 ref. OWRR A-036-GA(2). 14-31-0001-3810.

Descriptors: *Thunderstorms, *Storm structure, *Artificial storms, *Rainfall simulators, Precipitation(Atmospheric), Cloud physics, Rainfall intensity, *Georgia, *Coastal plains, Simulation analysis, Model studies.
Identifiers: Tunderstorm cells, Thunderstorm simulation, *Sensitivity analysis.

In a sensitivity analysis of a previously developed digital model for the stochastic simulation of thunderstorm rainfall, patterns of rainfall were generated for each of several combinations of some key parameters of the model. Statistics based on the depth, duration, and intensity of the rainfall were computed from a set of generated storms and compared with similar statistics computed from another set of storms generated after one of the model parameters had been changed by a predetermined amount. The parameters studied (1) the parameter which establishes the spatial distribution of rainfall intensity within the thunderstorm cell, (2) the cell duration, and (3) the maximum size attained by the cell. The effects of the distribution coefficient on the rainfall at the maximum raingage were small. The rainfall characteristics were strongly affected by variations in the mean cell duration because, in the model, the maximum rainfall intensity is directly related to storm duration and because cells have an increasing tendency to merge and overlap when their duration is increased. The response of the model to variations in cell size were similar to those due to variations in cell duration but were less pronounced. The model is capable of reproducing the rainfall characteristics as measured in the field; however, it is recommended that the same parameter values not be used, unless they can be varified with local data, to generate thunderstorm rainfall for localities where rainfall characteristics are likely to differ significantly from those in the Georgia Coastal Plains.

DENDROCLIMATIC HISTORY OF SOUTHWESTERN UNITED STATES,
Arizona Univ., Tucson. Lab. of Tree-Ring Research.
H. C. Fritts, and E. H. Cathey.
Final Report for NOAA, Environmental Data Service, November 30, 1971. 48 p, 9 fig, 39 ref. NOAA 1-35241.

Descriptors: *Southwest U.S., *Paleoclimatology, *Weather data, *Climatic data, History, Climatology, Data collections, Meteorological data, Dendrochronology.
Identifiers: *Dendroclimatology.

Information is compiled on the climate of southwestern United States. This report on the present climate of the Colorado Plateau provides background information for a study of significant historical climatic events of western North America. There appears to be considerable variability of climate over the century. A steep gradient of high moisture along the Pacific coast and low moisture east of the Rocky Mountains is apparent for 1801-1810. The Great Basin and the northern Colorado Plateau became more moist during 1811-1820. Moisture is more abundant in the extreme Southwest from 1926-1840, as the climate of California, Oregon, and Washington becomes dryer, 1836-1850. During the middle of the century the Great Basin is dry. In the last 4 decades of the century, Arizona and New Mexico are generally dry, while areas of high and low moisture vary in their positions along the West Coast. The severity of storms may have increased late in the century. The circulation over the Pacific Ocean appears least zonal early in the century, becoming more zonal toward the end of the century. The decades 1811-1820 and 1851-1860 show marked changes within the decade of zonal to weakly zonal conditions. (Knapp-USGS)
W74-06290

A BLOCKED MINIMAL TROPICAL DEPRESSION BECOMES A STORM OF RARE OCCURRENCE,
National Weather Service, Quincy, Fla.
D. R. Davis, and W. C. Bridges.
Available from NTIS, Springfield, Va. 22151 NOAA NWS SR-59, Price $3.00 printed copy; $1.45 microfiche. National Oceanic and Atmospheric Administration Technical Memorandum NWS SR-59, October 1971. 18 p, 15 fig, 2 tab, 11 ref.

Descriptors: *Tropical cyclones, *Storms, *Florida, *Weather patterns, Floods, Storm runoff, Rain, Rainfall, Historic floods, Meteorology, Storm structure, Synoptic analysis.

A small tropical low, marginal in intensity between a depression and disturbance, moved out of the Gulf of Mexico on September 19-20, 1969. An absence of steering currents aloft and the blocking action of a surface high caused the low to become stationary on the Florida coast for approximately 48 hours. Torrential, record-breaking rains occurred in a small area 60-65 miles to the east and 50 miles inland from the point where the low made landfall. Record-breaking floods resulted. The 23-inch maximum rainfall in 1969 was about 9 inches greater than the previous maximum rainfall of record produced by a 1924 tropical storm in the same area. The location of the area of maximum rainfall, with respect to the point of landfall of the low's center, closely follows the pattern previously reported for the more intense hurricanes and tropical storms. ON THE CAUSES OF ARIDITY ALONG A SELECTED GROUP OF COASTS,
Wisconsin Univ., Milwaukee. Dept. of Geography.
P. E. Lydolph.
In: Coastal Deserts, their natural and human environments, ed. by D.H.K. Amiran and A.W. Wilson, University of Arizona Press, Tucson, 1973. p 67-72, 2 fig, 5 ref.

Descriptors: *Coasts, *Arid lands, *Air circulation, *Winds, Arid climates, Deserts, Semiarid climates, Climatic zones, Climatic data, Droughts, Climatology, Seasonal, Atmosphere, Meteorology, Precipitation(Atmospheric), Topography, Weather, Land forming, Geomorphology.
Identifiers: *Peru.

Coastal deserts have many features in common: they are found at similar latitudes in both hemispheres on the western coasts of continents, and the rainfall distribution with latitude in these areas shows great similarity. These similarities obtain for the five principal coastal deserts throughout the year. The aridity in these zones is closely associated with their active contact with the paralleling flows of atmospheric and oceanic circulations. A theory associating aridity with the differences in wind speed associated with changes of surface friction is also set forth, as in Heinz Lettau's theory on coastal arid zone formation. This theory applies to meridionally-oriented long-sloping terrain in coastal areas where pressure gradients develop from differential heating in the diurnal cycle. This induces a fluctuating jet stream perpendicular to the pressure gradient and thus parallel to the coast. The variability of the stream in moisture content with time of day and seasonal directional alteration accounts for the aridity of the coastal regions involved. This model is somewhat supported by observed climatic conditions of a meteorologic study of Peru. (Muller-Arizona)

ON THE ORIGIN OF THE DRY CLIMATE IN NORTHERN SOUTH AMERICA AND THE SOUTHERN CARIBBEAN,
Oregon State Univ., Corvallis. Dept. of Geography.
J. F. Lahey.
In: Coastal Deserts, their natural and human environments, ed. by D.H.K. Amiran and A.W. Wilson, University of Arizona Press, Tucson, 1973. p 75-90, 36 fig, 1 tab, 4 ref.

Descriptors: *Arid lands, *Arid climates, Climatology, Atmosphere, Atmospheric pressure, Climatic zones, Climatic data, Droughts, Meteorology, Orography, Precipitation(Atmospheric), Temperature, Topography, Weather data, Winds, *South America.
Identifiers: *Caribbean Sea.

Venezuela, Colombia, and the Netherlands West Indies occupy the arid northern coast of South America. Their climate is characterized by extended dry periods in late winter and spring, a summer of light and scattered rainfall, a late summer of increasingly frequent extended droughts, followed by a season of increased frequency of scattered light rains of early fall, and a primarily rainy season until late January, followed a season of decreasing widespread rains to complete the cycle. A detailed analysis of the dry-area windfields through the year in this region show that these fields position the hemispheric cyclones and anticyclones in a manner which accounts for the temporal and spatial variability observed. The orography of the region and the thermal features of the earth as they affect airflow and precipitation in the region are also analyzed from a causal point of view with respect climate. A seasonal description of flow configurations of the upper atmosphere (mean 500-millibar levels) and a demonstration of their relationship to the seasonal variations of aridity in the study area are included. (Muller-Arizona)

THE COASTAL DESERT OF CHILE,
O. R. Borgel.
In: Coastal Deserts, their natural and human environments, ed. by D. H. K. Amiran, and A. W. Wilson. University of Arizona Press, Tucson, 1973, p 111-114. 6 ref.

Descriptors: *Arid climates, *Coastal plains, *Orography, *Desert plants, Atmospheric pressure, Precipitation(Atmospheric), Climatic zones, *Meteorology, Droughts, Topography, Weather, South America, Deserts, Environmental effects, Groundwater.
Identifiers: *Chile.

The location of Chile on the fault scarp along the East Pacific situates it so that only a narrow continental shelf and small coastal plain are available for the transition from a marine to a terrestrial environment. The Humboldt Current imposes thermal inversions on the area which cause zones of aridity that extend deep into the continent. Vegetation is virtually non existent in the deserts of the Chilean coast, primarily due to the destruction of the native tamarugo which was used for fuel for the local nitrate industry at the end of the last century. There are indications that the groundwater resources of the area, which have been thought sufficient until recently, are diminishing. These conditions are discouraging to the development and maintenance of local agriculture. The geomorphology, drainage, and vegetation of the area are described. (Muller-Arizona)
W74-06473

CLIMATIC PROFILE OF THE NORTH CHILEAN DESERT AT LATITUDE 20 DEGREES SOUTH,
Saskatchewan Univ., Regina. Dept. of Grography.
L. C. Caviedes.
In: Coastal Deserts, their natural and human environments, ed. by D. H. K. Amiran, and A. W. Wilson, University of Arizona Press, Tucson, 1973, p 115-121. 3 fig, 5 tab, 18 ref.

Descriptors: *Arid lands, *Arid climates, Climatology, *Anticyclones, *Ocean currents, *Topography, Atmosphere, Atmospheric pressure, Climatic zones, Climatic data, Meteorology, Droughts, Orography, Precipitation(Atmospheric), Clouds, Coastal plains.
Identifiers: *Chile.

Climatic factors affecting the North Chilean desert are evaluated and their relationships to the various types of arid climate found in the region are analyzed. The landscape of the area is divided into the Coastal Cordillera, the central plateau, and the Cordillera of the Andes, all in north-south alignment. Climatically the region can be divided into the coastal desert, pampas, the Andean piedmont, and the arid high Andes. The climate of the area is attributable to the interaction of the four elements: the location of the area on the margin of the South Pacific anticyclone, the proximity to the cold Humboldt current, the atmospheric subsidence in the area with the resultant deficit in humidity, and influence of topography. The interaction of these parameters in the environment of the North Chilean Desert is discussed in terms of arid climate causing conditions. (Muller-Arizona)
W74-06475

THE PLIO-QUATERNARY CLIMATIC CHANGES ALONG THE SEMIARID SEABOARD OF CHILE,
Tunis Univ. (Tunisia). Dept. of Geography.
R. Paskoff.
In: Coastal Deserts, their natural and human environments, ed. by D. H. K. Amiran, and A. W. Wilson. University of Arizona Press, Tucson, 1973, p 147-151. 2 fig, 14 ref.

Descriptors: *Climatology, *Geomorphology, *Quaternary period, *Paleoclimatology, Landforms, Vegetation, Climatic zones, South America, Environment, Humidity, Meteorology, Paleohydrology, Coasts.
Identifiers: *Chile.

The Plio-Quaternary changes of climate along the semiarid coastal region of Chile are discussed. Two principal conclusions are made. First, the end of the Tertiary probably had a climate of the warm humid tropical type with dry seasons of varying importance; it changed toward the Quaternary with a reduction in temperature and rainfall. Second, humid alternating phases characterize the Pleistocene, accompanied by a cooling of the atmosphere and dry periods of warming. These results correlate with the worldwide climatic estimates for the subtropical latitudes. Although the current climate in the region is that of a superarid desert, the geomorphologic features of the area indicate more humid periods in its geologic history. These features are listed and discussed. (Muller-Arizona)

2C. Snow, Ice, and Frost

EXTRA-TERRESTRIAL MN-53 IN ANTARCTIC ICE,
Commissariat a l'Energie Atomique, Saclay (France). Centre d'Etudes Nucleaires.
R. Bibron, R. Chesselet, G. Crozaz, G. Leger, and J. P. Mennessier.
Earth and Planetary Science Letters, Vol 21, No 2, p 109-116, January 1974, 1 tab, 26 ref.

Descriptors: *Manganese, *Glaciers, *Antarctic, Tracers, Dusts, Fallout.
Identifiers: Extraterrestrial manganese.

Mn-53 is a radionuclide linked specifically to interplanetary dust. Snow samples collected on the Eastern Antarctic Plateau in the vicinity of Plateau Station were analyzed for Mn-53. The measurements were carried out by neutron activation and X-ray spectrometry on three samples weighing a few hundred kg and each covering the time interval 1935-1950. The specific activity of Mn-53 was 0.82 plus or minus 0.17 disintegration per min per 1000 tons of snow. The bulk of the Mn-53 found at Plateau Station is associated with interplanetary dust in which it had been produced by the action of solar protons on iron. The deposition rate of extraterrestrial dustborne iron must be between 0.000013 and 0.00013 g per sq m per year at Plateau Station. These results support jointly with other studies the concept of an interplanetary zodiacal cloud of dust with a chemical composition and density not essentially different from chondritic meteorites, with a relatively flat grain size distribution and a mass influx to the earth of the order of 100,000 tons per yr. PERMAFROST: RELATION BETWEEN ICE CONTENT AND DIELECTRIC LOSSES AT 100 DEG K,
California Univ., Berkeley. Dept. of Geosciences.
R. Alvarez.
Earth and Planetary Science Letters, Vol 20, No 3, p 409-414, November 1973. 4 fig, 2 tab, 15 ref. NASA Grant NGR 05-003-572.

Descriptors: *Permafrost, *Ice, *Frozen ground, *Electrical studies, Frozen soils, Instrumentation.
Identifiers: Dielectric effect.

The dielectric response of permafrost at 100 deg K was analyzed at ice contents from 1% to 18.6%. The distributions obtained correspond to dielectric relaxations of the Cole-Cole type, with maximum losses occurring in the 30 to 600 Hz frequency range. The logarithms of such maxima depend linearly on the permafrost ice content, two regions of linear variation being defined above and below 3.6% ice content. Such relations point out the feasibility of determining ice content in permafrost by electromagnetic means. (Knapp-USGS)

GLACIERS--A PICTURE STORY,
M. Hill.
California Geology, Vol 27, No 2, p 23-44, February 1974. 37 fig, 10 ref.

Descriptors: *Glaciers, *Glaciology, Glaciohydrology, Melt water, *Reviews, Alaska, California.

There are about 1100 glaciers in the mountains of the western states, and another 5000 cover much of Alaska. Most of the approximately 80 glaciers in California lie in cirques. They are all very small; few are more than a mile in length. Glaciers, glacial movement, sediment transport, and meltwater hydrology are illustrated with 37 figures in this review intended for general readership. (Knapp-USGS)

NATIONAL WEATHER SERVICE RIVER FORECAST SYSTEM--SNOW ACCUMULATION AND ABLATION MODEL,
National Weather Service, Silver Spring, Md.
E. A. Anderson.
Technical Memorandum NWS HYDRO-17, November 1973. 217 p.

Descriptors: *Computer programs, *Snowmelt, *Mathematical models, Rainfall-runoff relationships, Streamflow forecasting, Runoff forecasting, Snowfall, Ablation, Water yield.

Described are a model of the snow accumulation and ablation process and the associated computer subroutines and programs which enable the model to be used in conjunction with the National Weather Service River Forecast System. Guidelines and methods for determining model parameter values for a given area are also presented. Even though the snow subroutines are written for use with the NWSRFS, the snow accumulation and ablation model itself can be used with almost any soil-moisture accounting (rainfall-runoff relationship) and channel routing procedure. The output from the snow model would be the input to the soil-moisture accounting procedure. The output from the snow model is snowpack outflow (snowmelt water and rainwater leaving the snowpack) plus rain that fell on bare ground. The snow accumulation and ablation model uses air temperature as the sole index to energy exchange across the snow-air interface. (Knapp-USGS)

AREAL SNOW COVER OBSERVATIONS IN THE CENTRAL ROCKIES, COLORADO,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
A. D. Haeffner, and C. F. Leaf.
USDA Forest Service General Technical Report RM-5, Nov. 1973. 15 p, 8 fig, 4 tab, 16 ref.

Descriptors: Snow, *Snowmelt, *Snow surveys, *Rocky Mountain Region, *Colorado, Watersheds(Basins), Hydrology, Areal, Mapping, Aerial photography, Streamflow, Water balance, Data collections, *Forecasting, Projections.
Identifiers: Fraser Experimental Forest(Colo).

Photographic records of areal snow cover depletion during the 1964-71 snowmelt seasons in the Fraser Experimental Forest, and in the Park Range from 1966-71, are summarized. Included are detailed estimates of snow cover extent on more than 90 hydrologic subunits which comprise the six watersheds photographed. Applications of these data in streamflow forecasting, water balance analyses, and snow cover duration are suggested. (Brown-IPC)

DISTANCES OF FLOWAGE OF SNOW AVALANCHES IN THE CENTRAL AND WESTERN CAUCASUS (DAL'NOSTI VYBROSA SNEZHNYKH LAVIN NA TSENTRAL'NOM I ZAPADNOM KAVKAZE),
Moscow State Univ. (USSR). Problemnaya Laboratoriya Nezhnykh Lavin i Selei.
V. P. Blagoveshchenskiy.
Vestnik Moskovskogo Universiteta, Seriya V, Geografiya, No 6, p 95-97, November-December 1973. 1 tab, 5 ref.

Descriptors: *Avalanches, *Snow, *Distance, Geomorphology, Slopes, Climatology.
Identifiers: *USSR(Caucasus).

Determination of maximum distance of flowage of snow avalanches in the Central and Western Caucasus was based on data collected during field work and aerial photo interpretation in upper reaches of the Bol'shoy Zelenchuk and Baksan River valleys. Differences observed in distances of flowage of avalanches in the Central and Western Caucasus are due mainly to geomorphological differences in the regions. The distance of flowage increases with increasing size and decreasing slope angle of the avalanche catchment area. Analytical expressions are obtained for relating avalanche-flowage distance and air-wave formation to size and slope inclination of the catchment area. (Josefson-USGS)

A PRELIMINARY ASSESSMENT OF SNOWFALL INTERCEPTION IN ARIZONA PONDEROSA PINE FOREST,
Arizona Univ., Tucson. Dept. of Watershed Management.
L. C. Tennyson, P. F. Ffolliott, and D. B. Thorud.
In: Hydrology and Water Resources in Arizona and the Southwest, Proc. of the Arizona Section--American Water Resources Association, and the Hydrology Section--Arizona Academy of Science, Tucson, Arizona, May 4-5, 1973, Vol 3, p 17-20 (1973). 1 fig, 8 ref.

Descriptors: *Snowfall, *Interception, *Snow removal, *Arizona, *Ponderosa pine trees, Snowpack, Snowmelt, Stemflow, Canopy, Water yield improvement, Wind erosion.

A preliminary assessment and ranking of the relative significance of five processes that may contribute to snow removal from ponderosa pine forest canopies was made, including wind erosion of canopy snow, snowslide from the canopy, stemflow, vapor transport from melt water, and vapor transport of canopy snow. The first three represent delayed delivery rather than net water loss. A snow load index was obtained through use of time lapse photography of the study site canopy, while incoming solar radiation and atmospheric processes were monitored. The snow load index was expressed as a ratio of forest canopy area covered with snow to the total canopy area. Results obtained over a 4-day period following a six-hour snowstorm showed that snow removal by snowslide and wind erosion was of significant importance, while vapor transport of melt water and canopy snow, stemflow, and dripping of melt water was of comparatively minor importance. FLOOD OF JULY 17, 1972 IN GALLUP, NEW MEXICO,
Geological Survey, Albuquerque, N. Mex.
L. A. Waite.
Available from NTIS, Springfield, Va 22151 as PB-225 031/4As, Price $3.00 printed copy; $1.45 microfiche. Water-Resources Investigations 43-73, October 1973. 8 p, 2 fig, 2 ref.

Descriptors: *Floods, *Hydrologic data, *New Mexico, Disasters, Water levels, Stage-discharge relations.
Identifiers: Gallup(N Mex).

On July 17, 1972 severe flooding occurred in Gallup, N. Mex. An isolated storm approximately 9 miles east of Gallup covering 20 of the 558 square miles drained by the Puerco River was responsible. Floodwaters reached a peak gage height of 15.3 feet and peak discharge of 12,000 cubic feet per second at the crest-stage gage located on the Puerco River in Gallup. Peak discharge was 1.8 times a 50-year flood. Floodwaters damaged 120 residences, 48 businesses, and 11 public buildings and facilities. Total damages were estimated at $1,293,000. (Knapp-USGS)
W74-06267

MAGNITUDE AND FREQUENCY OF FLOODS IN ILLINOIS,
Geological Survey, Champaign, Ill.
J. M. Carns.
Illinois Division of Water Resource Management Publication, 1973. 599 p, 7 fig, 12 tab, 11 ref.

Descriptors: *Floods, *Illinois, Discharge(Water), *Hydrologic data, *Data collections, Peak discharge, *Flood frequency, Flood recurrence interval, Stage-discharge relations.

Flood-peak data and methods of estimating the magnitude and frequency of floods for most streams in Illinois are presented. Flood-frequency curves are given for gaged sites where 10 or more years of flood records have been collected. Flood characteristics from these curves were related, by multiple-regression analysis, to drainage basin characteristics. Regional equations are presented which relate flood-peak discharges to recurrence intervals of 1.25, 2, 5, 10, 25, 50 and 100 years using drainage area, main-channel slope, rainfall intensity, and a regional factor as independent variables. These equations can be used to estimate the magnitude and frequency of floods at most ungaged sites where flood discharges are not significantly affected by regulation or urbanization. Graphs are presented for estimating flood magnitudes on some streams where the regional equations are not applicable. A compilation is included of peak stages and discharges at gaging stations having 5 or more years of record. Where available, all floods above a selected base are included in the tabulations. Only the annual maximum floods are shown for other stations. (Knapp-USGS)

FLOOD OF SEPTEMBER 3, 1972, IN HILLSBORO, NEW MEXICO,
Geological Survey, Albuquerque, N. Mex.
L. A. Waite.
Open-file report, October 1973. 19 p, 2 fig, 5 ref.

Descriptors: *Floods, *New Mexico, Peak discharge, Disasters, Storm runoff.
Identifiers: *Hillsboro(N Mex).

A flood struck the village of Hillsboro, N. Mex., during the early morning hours of September 3, 1972. Hillsboro is situated at the confluence of Percha Creek and its main tributary, North Percha Creek. Heavy rainfall in the drainage basin upstream from Hillsboro occurred during the night of September 2-3. Peak discharge computed by slope-area measurements indicated that Percha Creek carried a maximum flow of 346 cubic meters per second and that North Percha Creek carried a flow of 592 cu m per second at points just upstream from Hillsboro. Levees on the south bank of Percha Creek failed and floodwaters reached depths of 1.8 meters in Hillsboro. (Knapp-USGS)

ASYNCHRONOUS LONG-PERIOD STREAMFLOW FLUCTUATIONS IN THE EUROPEAN USSR (ASINKHRONNOST' MNOGOLETNIKH KOLEBANIY STOKA REK YEVROPEYSKOY TERRITORII SSSR),
N. P. Smirnov.
Izvestiya Vsesoyuznogo Geograficheskogo Obshchestva, Vol 104, No 1, p 59-63, January-February 1972. 2 fig, 2 tab, 5 ref.

Descriptors: *Streamflow, *Fluctuations, *Statistical methods, Correlation analysis, Runoff, Discharge(Water), Gaging stations, Mapping.
Identifiers: *USSR(European region).

To study asynchronous long-period fluctuations of streamflow in the European part of the USSR, data were selected on average annual discharges at 19 gaging stations for 1915-64. Streamflow fluctuations in European Russia are generally relatively inhomogeneous. Long-period streamflow fluctuations are characterized by both a zonal and meridional asynchronism. Estimate of the expansion of fields of average annual streamflow for the first six terms of the expansion, and coefficients of correlation between coefficients of the expansion of average annual runoff and discharges at individual gaging stations are tabulated. Fields of the first three eigenvectors of expansion of average annual streamflow are mapped. Use of the method of expansion into natural orthogonal functions for investigation of long-period streamflow fluctuations makes it possible to divide an area into zones on the basis of the character of these fluctuations. (Josefson-USGS)
W74-06305

FLOOD OF SEPTEMBER 1971 IN SOUTHEASTERN PENNSYLVANIA,
Geological Survey, Harrisburg, Pa.
L. V. Page, and L. C. Shaw.
Open-file report, 1973. 33 p, 13 fig, 3 tab.

Descriptors: *Floods, *Storm runoff, *Urban runoff, *Pennsylvania, Peak discharge, Disasters.
Identifiers: *Delaware River Basin(Pa).

Record-breaking floods on Sept. 13, 1971, occurred in some urbanized basins of southeastern Pennsylvania. This flooding resulted from heavy, intermittent thunderstorms on Sept. 11-13, 1971, which produced 8 to 12 inches of rainfall in the basins of Skippack, Stony, and Chester Creeks. Rain was heaviest during midday of the 13th. The Chester and Norristown areas were declared Flood Disaster Areas by the Federal and State Governments. Peak stages and discharges are given for 25 gaging stations and 4 miscellaneous sites. Flood profiles are shown for Chester Creek, West Branch Chester Creek, and Stony Creek. (Knapp-USGS)

INFLOW OF RIVER WATERS TO THE BALTIC SEA FROM THE USSR (PRITOK RECHNYKH VOD V BALTIYSKOYE MORE S TERRITORII SSSR),
T. Ye. Grigorkina.

Izvestiya Vsesoyuznogo Geograficheskogo Obshchestva, Vol 104, No 2, p 130-134, March-April 1972. 2 fig, 3 tab, 6 ref.

Descriptors: *Inflow, *Rivers, *Runoff, Runoff coefficient, Watersheds(Basins), River basins, Discharge(Water).
Identifiers: *USSR(Baltic Sea).

Runoff of rivers draining into the Baltic Sea from the Soviet Union was calculated on the basis of recent hydrometric data. The length of record at outlet gaging stations of major rivers ranges from 23 years for the Luga River at Kingisepp to 156 years for the Neman River at Smalininkai. The highest rate of runoff is observed in the Parnu and Salaca River basins (9.28 liters/sec/sq km) and the smallest in the Pregel River basin (6.34 liters/sec/sq km). Average long-period runoff of Soviet rivers into the Baltic Sea is 160 cu km/yr. (Josefson-USGS)

2F. Groundwater

HYSTERETIC WATER FLOW IN A POROUS MEDIUM: EXPERIMENTAL STUDY AND NUMERICAL SIMULATION,
Illinois Univ., Urbana. Dept. of Agronomy.
R. W. Gillham.
Ph D Thesis, 1973. 91 p, 31 fig, 27 ref, append. OWRR A-014-COLO (1), 14-31-0001-3806.

Descriptors: *Simulation analysis, *Numerical analysis, *Hysteresis, *Soil water movement, Wetting, Drying, Groundwater movement, *Porous media, *Unsaturated flow, Saturated flow, Drainage.

The differential equation describing the flow of the solution phase in a partially saturated porous medium can be solved numerically to predict the time and spatial distributions of water content and pressure head which would result from imposed initial and boundary conditions. Most porous media have a highly hysteretic water content-pressure head relationship, and since natural boundary conditions induce hysteretic flow systems, hysteresis should be accounted for in solutions of the flow equation. Good agreement found between the predicted and measured values for the slow drainage-rewet experiment indicated that under the conditions of this experiment the unsaturated flow equation is an adequate description of the flow process. The numerical solution used was an adequate solution of the flow equation for a nonuniform medium. The scale of the nonuniformity in the medium used was rather small. It is not necessarily true that the procedure would work equally well for a medium having zones with large textural differences. The nonhysteretic simulation of the slow drainage-rewet experiment predicted the pressure head distribution with as great an accuracy as did the hysteretic simulation. The nonhysteretic simulation resulted in large errors in the predicted water content values. The hysteretic uniform medium simulation suggested that small nonuniformities in the medium could cause significant errors in the predicted water content values. (Knapp-USGS)
W74-05959

A MULTILAYER AQUIFER MODEL OF THE OGALLALA FORMATION IN OKLAHOMA,
Oklahoma State Univ., Stillwater.
J. T. Chowning.
Available from the National Technical Information Service as PB-230 424, $6.50 in paper copy, $1.45 in microfiche. M Sc Thesis, July 1973. 56 p, 22 fig, 8 tab, 16 ref. OWRR A-038-OKLA (2).

Descriptors: *Hydrogeology, *Model studies, *Withdrawal, Mathematical models, Hydraulic models, *Oklahoma, Water yield, Drawdown, Aquifer testing, *Aquifer characteristics.
Identifiers: *Ogallala aquifer(Okla).

The effects of layering on an aquifer were studied to obtain a better definition of the properties of the Ogallala Formation in the panhandle of Oklahoma. Two sand models simulated the conditions found in this area. Laboratory analysis of sand samples from the area were used to give an initial definition of the materials used in the model study. The validity of using a layered approach as opposed to a homogeneous approach in a computer modeling of the aquifer is supported by some of the data obtained. Transmissibilities of layers in combinations are approximated by a summation of the layer transmissibilities. Dewatering of the formation may be represented by holding the permeability of each layer constant and allowing the transmissibility to change as the formation is dewatered. The average of the specific yield values from the gravity drainage test was 0.13. (Knapp-USGS)

GEOPHYSICAL INVESTIGATIONS OF WASHINGTON'S GROUND WATER RESOURCES,
Washington State Univ., Pullman. Coll. of Engineering.
B. A. Siems, J. W. Crosby, J. V. Anderson, III, J. H. Bush, and T. L. Weber.
Washington Department of Ecology Technical Report 73-034 (R.P. 1221), July 1973. 59 p, 22 fig, 2 tab, 23 ref, append.

Descriptors: *Borehole geophysics, *Hydrogeology, *Stratigraphy, *Washington, Data collections, *Hydrologic data, Data processing, Data storage and retrieval, Electrical well logging, Radioactive well logging.
Identifiers: *Columbia plateau(Wash).

Since 1967 the Geohydrology Section at Washington State University has acquired geophysical log data from irrigation wells on the Columbia Plateau. A nearly complete listing of wells logged by county and legal description is given. The oldest log suites contain only natural gamma, spontaneous potential, wall rock resistivity, caliper, and neutron-neutron logs. In more recent work the following additional logs have been collected: temperature, fluid resistivity, neutron-gamma, and gamma-gamma logs. Most available log suites will contain nearly all of the logs, because the largest volume of data is recent. Vertical flowmeter logs were collected intermittently from about January 1972 to early 1973: since that time most suites have flowmeter data. Stratigraphic features from various areas are discussed in the section on stratigraphy. Selected wells are used to indicate those features recognized as locally or regionally significant. The routine availability of data in digitized form presents new opportunities for enhancing interpretation of geophysical borehole information. This increases the potential for quantitative evaluation of parameters such as porosity, density, moisture content, and gamma photon emission. Other opportunities exist for the formulation of various hybrid logs which may be useful in analyzing basalt stratigraphy. (Knapp-USGS)

GEOLOGY AND WATER RESOURCES OF EASTERN PART OF JUDITH BASIN, MONTANA,
Geological Survey, Billings, Mont.
R. D. Feltis.
Montana Bureau of Mines and Geology Bulletin 87, 1973. 51 p, 17 fig, 3 plate, 15 tab, 35 ref.

Descriptors: *Hydrogeology, Water resources, *Montana, *Data collections, *Hydrologic data, Surface waters, Groundwater, Water supply, Streamflow, Springs, Water yield, Limestones, Karst hydrology, Water utilization.
Identifiers: Judith Basin(Mont).

Nearly all water in eastern Judith Basin, Montana, originates from precipitation on the drainage basin. Annual precipitation ranges from about 13 inches in the basin interior to 39 inches in the mountains. In much of the area the aquifers are artesian, and some supply water for domestic and stock use. Some aquifers are potential sources of water for irrigation and industry. Most wells discharge less than 10 gallons per minute. Warm Spring and Big Springs, two first-magnitude springs, discharge mostly from limestone in the Madison Group; during the 1968 water year the springs discharged 106,000 and 90,000 acre-feet of water respectively. Precipitation and runoff recharge the cavernous limestone of the Madison Group. Comparison of the total precipitation on the Madison Group and on areas that yield runoff to the Madison and the discharge of the two first-magnitude springs shows that about 58 percent of the precipitation recharges the aquifer. A seepage run in Rock Creek in the Big Snowy Mountains showed that as much as 53 cubic feet per second infiltrates into the limestone from the creek. The total streamflow of the major perennial streams in eastern Judith Basin during the 1968 water year was 3000,000 acre-feet. This probably represents above-average runoff because 1967 and 1968 were periods of above-average precipitation. Water from most aquifers is hard but it is generally suitable for domestic and stock use. Water from the sandstone aquifers may contain undesirable amounts of iron, and corrosion of well casings is a problem in some wells producing water from the Swift Formation. (Knapp-USGS)

APPRAISAL OF THE QUALITY OF GROUND WATER IN THE HELENA VALLEY, MONTANA,
Geological Survey, Helena, Mont.
K. R. Wilke, and D. L. Coffin.
Available from NTIS, Springfield, Va 22151 as PB-224 563/As, Price $4.50 printed copy; $1.45 microfiche. Water-Resources Investigations 32-73, September 1973. 31 p, 2 fig, 4 tab, 12 ref.

Descriptors: *Water quality, *Groundwater, *Water pollution sources, *Montana, Nitrates, Chlorides, Hydrogeology, Coliforms, Trace elements, Septic tanks, Nutrients.
Identifiers: *Helena Valley(Mont).

Analyses of groundwater samples from the Helena valley in west-central Montana show that nitrate concentrations ranged from less than 0.1 to 6.3 mg/liter and that the median value was 0.9 mg/liter. Chloride concentrations ranged from 1.4 to 120 mg/liter, and the median value was 8.4 mg/liter. The sources of nitrate are in the valley, and areas of high nitrate concentrations coincide with areas of dense population. Results of bacteriological analyses of 65 samples of groundwater indicate that coliform bacteria were absent. Ten water samples analyzed for trace element content had a few moderately high concentrations of arsenic, copper, lead, and zinc. Groundwater in the Helena valley is a good quality and mostly a calcium bicarbonate type. Despite locally high dissolved-solids content, the water is suitable for drinking, according to U. S. Public Health Service standards. (Knapp-USGS)

OBSERVED CHANGES IN GROUNDWATER REGIME CAUSED BY THE CREATION OF LAKE DIEFENBAKER, SASKATCHEWAN,
Department of the Environment, Ottawa (Ontario). Inland Waters Branch.
R. O. Van Everdingen.
Technical Bulletin No 59, 1972. 65 p, 6 fig, 5 tab, 7 ref, 2 append.

Descriptors: *Surface-groundwater relationships, *Reservoir leakage, *Canada, Seepage, Glacial drift, Gravels, Water level fluctuations, Piezometers, Artesian aquifers.
Identifiers: *Lake Diefenbaker(Saskatchewan).

Measurements between 1964 and 1971 of piezometric levels in 35 piezometers installed in 9 groups in a multiple aquifer system and in unconsolidated sediments in a section across the valley of the South Saskatchewan River near Riverhurst, Saskatchewan, revealed increased piezometric pressures as a result of the creation of Lake Diefenbaker. The increases in pressure, which vary with the water level in the reservoir, reflect a hydraulic connection between the aquifers and the reservoir, and not a classical loading effect. The stability of the area immediately downstream from the dam may have been adversely affected by these pressure increases. Groundwater discharge rates have been reduced significantly, and some loss of water from the reservoir appears to take place. (Knapp-USGS)

HYDROLOGY OF BASALT AQUIFERS AND DEPLETION OF GROUND WATER IN EAST-CENTRAL WASHINGTON,
Geological Survey, Tacoma, Wash.
J. E. Luzier, and R. J. Burt.
Washington Department of Ecology, Olympia, Water-Supply Bulletin No 33, 1974. 53 p, 25 fig, 3 plate, 3 tab, 24 ref, append.

Descriptors: *Hydrogeology, *Washington, *Withdrawal, Water yield, Water levels, *Basalts, *Aquifer characteristics, Transmissivity, Groundwater movement, Water resources development.

Groundwater available for large-scale withdrawal in east-central Washington occurs principally in a thick sequence of basalt flows known as the Columbia River Group. Permeable flow-contact zones within the sequence form the major aquifers of the region, and their slight regional dip to the southwest partly controls the general direction of groundwater movement. Groundwater in the flow-contact zones normally is confined by dense basalt of low permeability, and the heads in the basalt sequence generally decrease with increasing aquifer depth. Uncased well bores, 500-1,000 feet deep, interconnect a series of aquifers that otherwise are poorly connected hydraulically. Water from upper aquifers, used chiefly for domestic and stock supplies, drains continuously in most areas through the uncased irrigation wells into deeper aquifers having lower artesian pressures. This short-circuiting effect has contributed to the declines of water levels in upper aquifers, especially in the intensively pumped Odessa area. Pumpage from basalt aquifers increased from about 44,000 acre-feet in 1963 to about 149,000 acre-feet in 1968. Annual rates of decline, averaging about 2 feet for many years, have increased to about 3 feet during 1965-69. Conditions that have led to depletion of groundwater in basalt aquifers of the region include: (1) high rates of pumping withdrawal for consumptive use; (2) dense well spacing; (3) the small storage capacity and low vertical permeability of the basalt; (4) little recharge from precipitation; (5) leakage through uncased well bores; and (6) the presence of impermeable hydraulic boundaries. ELECTRICAL ANALOG MODEL STUDY OF THE ALLUVIAL AQUIFER IN THE YABUCOA VALLEY, PUERTO RICO: PHASE 2--THE PLANNING, CONSTRUCTION AND USE OF THE MODEL,
Geological Survey of Puerto Rico, San Juan.
T. M. Robison, and R. B. Anders.
Open-file report 73-1, 1973. 22 p, 13 fig, 7 ref.

Descriptors: *Hydrogeology, *Analog models, *Puerto Rico, *Water yield, *Saline water intrusion, Drawdown, Withdrawal, Alluvium, Alluvial channels, Safe yield, Transmissivity, Storage coefficient, Recharge, Water balance.
Identifiers: *Yabucoa Valley(PR).

A three-layer electrical analog model was used to study the Yabucoa Valley alluvial aquifer in southeastern Puerto Rico. The aquifer occupies a broad, deep valley incised in granitic bedrock and extends about 1-1/2 miles under the Caribbean Sea. The average and maximum thicknesses of the aquifer are about 200 and 300 feet, respectively. Its area is about 17 square miles. The aquifer has a maximum transmissivity of about 7,000 square feet per day, a range of hydraulic conductivities of from 10 to 30 feet per day, and and a vertical anisotropy of 10,000:1. About 60 billion gallons of predominantly freshwater is stored in the landward part of the aquifer. The steady-state version of the model indicated that the aquifer has a net recharge and discharge of about 3 mgd. About 1 mgd of the discharge is to sea and to an artificial harbor. In the nonsteady-state version, approximately 12 mgd was pumped from the aquifer for 50 years. The sea was the main source of intruding seawater, whereas the artificial harbor was a lesser source. It was estimated that the first arrival of the intruding seawater at a well would occur after 40 years of pumping. Some possible locations for monitoring and interceptor wells were determined. Freshwater or air-injection wells also might be used at these sites to halt the influx of seawater. The total freshwater recharge potential of the area is estimated to be about 20 mgd. However, to attempt to develop the resource at that rate would cause drawdowns and seawater input, especially from the harbor, to become prohibitive. (Knapp-USGS)

SUBSURFACE COMPONENT OF THE HYDROLOGIC BUDGET OF THE CASPIAN SEA (O PODZEMNOY SOSTAVLYAYUSHCHEY VODNOGO BALANSA KASPIYSKOGO MORYA),
I. S. Zektser, and A. V. Meskheteli.
Izvestiya Vsesoyuznogo Geograficheskogo Obshchestva, Vol 104, No 2, p 88-94, March-April 1972. 27 ref.

Descriptors: *Hydrologic budget, *Groundwater, *Base flow, Water balance, Inflow, Discharge(Water), Water temperature, Winds.
Identifiers: *USSR(Caspian Sea).

Views on origin of the negative temperature anomaly off the eastern shore of the Middle Caspian vary as do estimates of groundwater runoff into the Caspian and of its role in the hydrologic budget of the sea. Values of groundwater runoff into the sea differ by a factor of more than 150, ranging from 0.3 cu km/yr to 49.3 cu km/yr. Basic directions are indicated for studying groundwater runoff into the sea to solve a number of important theoretical and practical problems. (Josefson-USGS)

STEADY-STATE PATTERNS OF RAINWATER SEEPING THROUGH BEDDED SOIL WITH AND WITHOUT TILE DRAINS,
Iowa State Univ., Ames. Dept. of Agronomy.

N. L. Powell.
Available from the National Technical Information Service as PB-230 949 $1.45 in paper copy, $1.45 in microfiche. Ph D Thesis, 1973. 191 p, 26 fig, 6 tab, 38 ref, 3 append. OWRR A-044-IA (2).

Descriptors: *Soil water movement, *Saturated flow, *Drainage water, Mathematical models, Hydraulic models, *Tile drains, Infiltration, Laplaces equation, Excess water(Soils), *Seepage.

A modified Gram-Schmidt method was used to obtain the mathematical solution for two boundary value problems of soil water drainage. The flow medium was assumed to be water saturated. Only the steady-state condition was considered. In the first problem the seepage patterns of rainwater flowing through soil were determined. The soil is underlain by an impermeable barrier at a finite depth. A tile drain is half embedded in the impermeable barrier and located directly below furrows in the surface. In the second problem the seepage patterns of rainwater flowing through soil of infinite depth are determined. Water is allowed to stand in the drainage furrows. The solutions were obtained from potential theory by solving Laplace's equation to satisfy an appropriate set of boundary conditions. For the tile drain problem, between 16% and 100% of the minimum rainfall needed to keep the flow medium saturated passes through the flow medium to the tile drain. In some cases the water which enters the soil at the surface flows to the tile drain and does not resurface downslope. In other cases water enters the soil upslope and resurfaces again downslope. For the soil of infinite depth with no tiles, as little as 13% of the minimum rainfall passes through the flow region for a constant slope soil surface, and as high as 77% of the minimum rainfall passes through the flow region for an elliptic-shaped soil surface. Water enters the soil upslope above a critical point and after flowing through the soil resurfaces again downslope and adds to surface runoff. Photographic sequence pictures illustrate the development of streamlines in plexiglas laboratory models filled with sand. There is good agreement between the laboratory models and the mathematical analysis. (Knapp-USGS)

GROWTH AND MOISTURE AVAILABILITY OF SHELTERBELTS IN THE KULUNDA STEPPE (ROST I VLAGOOBESPECHENNOST' LESNYKH POLOS V KULUNDINSKOY STEPI),
O. S. Popova, L. A. Il'inykh, and V. P. Popov.
Pochvovedeniye, No 3, p 91-96, March 1973. 1 fig, 5 tab, 4 ref.

Descriptors: *Moisture availability, *Soil moisture, *Shelterbelts, *Trees, *Grasslands, Chestnut soils, Soil physical properties, Soil texture, Moisture content, Moisture uptake, Groundwater, Precipitation(Atmospheric), Evaporation, Seasonal.
Identifiers: *USSR(Kulunda Steppe).

Growth of balsam poplar, European white birch, and elm in narrow shelterbelts on Chestnut soils in the Kulunda Steppe in 1965-71 was investigated as a function of soil moisture content. Principal sources of water supply to trees in the steppe where groundwater occurs at great depths (8-10 m) are soil water accumulated during autumn and spring and precipitation occurring during the growing season. Practices designed to increase water supply to trees, such as deep plowing or trenching, planting of windbreaks for snow retention, and loosening of soil in spaces between rows of trees, are necessary to improve the water regime of shelterbelts. (Josefson-USGS)

LEACHING OF SALINE SOILS WITH DIFFERENT TYPES OF DRAINAGE (PROMYVKA ZASOLENNYKH POCHV PRI RAZLICHNYKH VIDAKH DRENAZHA),
M. M. El'Mansi.
Pochvovedeniye, No 3, p 79-85, March 1973. 2 fig, 2 tab.

Descriptors: *Land reclamation, *Drainage practices, *Leaching, *Saline soils, Salinity, Salts, Drains, Curves.
Identifiers: *USSR(Golodnaya Steppe).

Leaching of saline soils was studied at the 'Yangiyer' Sovkhoz in the Golodnaya Steppe (Uzbek SSR) in 1968. Leaching was performed over an area of about 100 ha. Data on estimates of effectiveness of different types of drainage during soil desalinization are analyzed, and optimal conditions for operation of drainage installations to achieve maximum effects from leaching are determined. Strongly saline soils in the 'Yangiyer' area can be reclaimed in 1 to 3 years using permanent deep closed drains (3.0-3.5 m deep, spaced 250 m apart) and temporary deep open drains (2.0-2.5 m deep, spaced 250 m apart) at an average leaching rate of about 50,000 cu m/ha. Results of studies were confirmed by large-scale leachings at the 'Yangiyer' Sovkhoz in 1969 and can be successfully used in reclaiming saline soils common to desert and semidesert regions of Asia and North Africa. (Josefson-USGS)

SPATIAL VARIATION PATTERNS OF MOISTURE CONTENT OF IRRIGATED SOIL UNDER COTTON (ZAKONOMERNOSTI PROSTRANSTVENNOY IZMENCHIVOSTI VLAZHNOSTI OROSHAYEMOY POCHVY POD KHLOPCHATNIKOM),
Sredneaziatskii Gosudarstvennyi Institut po Proektirovaniyu Irrigatsionnykh Sooruzhenii i Selskikh Elektrostantsii, Tashkent (USSR).
L. N. Poberezhskiy.
Pochvovedeniye, No 3, p 50-59, March 1973. 1 fig, 5 tab, 8 ref.

Descriptors: *Soil physics, *Soil moisture, *Irrigated land, *Cotton, Variability, Irrigation practices, Groundwater, Wells, Correlation analysis, Equations.
Identifiers: *USSR(Golodnaya Steppe), *USSR(Karshi Steppe).

Soil moisture measurements were carried out in a dense network of wells in the Golodnaya and Karshi Steppes in 1967-70. The depth of groundwater occurrence on two test plots in the Golodnaya Steppe is 3-4 m, and that on one test plot in the Karshi Steppe is about 1 m. Soil moisture was determined by the neutron method in all wells at the end of each 10-day period or month and before and after irrigation of cotton during the growing season. Spatial variability of moisture content of irrigated soil under cotton is determined primarily by irrigation and depth of groundwater occurrence. At a groundwater depth of 3-4 m and in the absence of irrigation, soil moisture variability during the nongrowing season is substantially smaller than during the growing season, and in both cases decreases with depth. Use of moisture correlation functions makes it possible to estimate the degree of synchronous change and the error of extrapolation of moisture content in soil layers of different thickness and to determine the optimal number of evenly spaced wells for estimation of average soil moisture content. Principal factors affecting areal distribution of soil moisture are analyzed, and the method of computation of moisture correlation functions is described. (Josefson-USGS)

EFFECTS OF A GENETIC SOIL GROUP ON RUNOFF (VLIYANIYE GENETICHESKOGO TIPA POCHVY NA STOK),
G. V. Nazarov.
Izvestiya Vsesoyuznogo Geograficheskogo Obshchestva, Vol 104, No 1, p 11-16, January-February 1972. 1 fig, 2 tab, 13 ref.

Descriptors: *Runoff, *Soil groups, *Chernozems, *Chestnut soils, *Podzols, Forest soils, Surface runoff, Overland flow, Snowmelt, Water equivalent, Permeability, Sprinkler irrigation.
Identifiers: *USSR(Kursk region).

The hydrologic importance of soil is determined mainly by its permeability and water-holding capacity. Permeability and other soil hydrophysical properties obey the law of zonality. Data are presented on sprinkler irrigation of recently plowed clay loam Podzolic soils, Typical Chernozems, and Chestnut soils. Typical Chernozems have the highest permeability and Ordinary and Leached Chernozems, a slightly lower permeability. Soil cover also plays an important role in surface runoff in spring. Comparative data on spring flow over Gray Forest soils and Typical Chernozems in the vicinity of Kursk show that Typical Chernozems in a frozen state have a higher permeability than Gray Forest soils. Surface runoff observed on Typical Chernozems was generally less. Higher surface runoff on Chernozems in the spring of 1965 was associated with a much higher water equivalent of snow. The effects of a genetic soil group on surface runoff are significant. (Josefson-USGS)

SIMULATION OF POST-IRRIGATION MOISTURE MOVEMENT,
Auburn Univ., Ala. Dept. of Civil Engineering.
F. J. Molz.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 98, No IR4, p 523-532, December, 1972. 9 fig, 1 tab, 12 ref.

Descriptors: *Irrigation, *Soil-water-plant relationships, *Soil water movement, Drainage, Soil water, *Root zone, Darcey's law, Mathematical models, Computer models, Root systems, *Transpiration, Water loss.

Transpiration-induced moisture removal by the plant roots is represented by a negative source term in the Darcy equation. When soil is wetted to near saturation, moisture flow is initially downward due to gravity. As transpiration dries the upper soil layers, capillary suction reverses the Darcian flow. Upward water flux through soil has a maximum which occurs high in the root zone initially and gradually moves downward. Throughout much of time periods studied there was downward flow in portions of the soil-root system. Very little water, if any, was obtained by the plants from below the root zone, but considerable moisture was often lost to this region. As the soil-root system dries, a point is reached at which the Darcian moisture flux in soil can be neglected and the moisture removal process described by local extraction alone. When this occurs, the root geometry assumes major importance in determining the water supply available to a plant. (Skogerboe-Colorado State)

EFFECTS OF A WETTING AGENT ON THE INFILTRATION CHARACTERISTICS OF A PONDEROSA PINE SOIL,
Arizona Univ., Tucson. Dept. of Watershed Management.
M. G. Kaplan, and M. J. Zwolinski.
In: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the Arizona Section--American Water Resources Association and the Hydrology Section--Arizona Academy of Science, Tucson, Arizona, May 4-5, 1973, Vol 3, p 21-25 (1973). 1 fig, 6 ref.

Descriptors: *Wetting, *Infiltration rates, *Litter bulk density, *Runoff, *Ponderosa pine trees, Infiltrometers, Soil moisture, Erosion, Surfactants, Resins, Antecedent moisture content, *Arizona, Watershed management.
Identifiers: *Hydrophobic soils.

Effects of the wetting agent 'WATER-IN' on infiltration rates and runoff were investigated on some hydrophobic soils in the ponderosa pine forest type of east-central Arizona. The treatment was applied to both bare mineral soil and soil covered with ponderosa pine litter at a rate of 10 gallons per acre. Infiltration rates were measured by a modified North Fork infiltrometer. A significant increase in infiltration rate was noted on the bare mineral soil, but a notable increase in runoff was observed on the litter covered plots due to 'WATER-IN' application. Water infiltration rate increases on the bare mineral soil plots is hypothesized to be the result of a decrease in average bulk density of the surface inch of soil. Other soil physical properties investigated were unchanged by the wetting agent. An increase in runoff from the litter treated by 'WATER-IN' is thought to be the result of a hydrophobic condition which previously did not exist. (Mastic-Arizona)

SOIL MOISTURE PATTERNS ON TWO CHAINED PINYON-JUNIPER SITES IN UTAH,
Utah State Univ., Logan. Coll. of Natural Resources.
G. F. Gifford, and C. B. Shaw.
Journal of Range Management, Vol 26, No 6, p 436-440, November, 1973. 6 fig, 2 tab, 3 ref.

Descriptors: *Soil moisture, *Forest management, *Pinyon pine trees, *Juniper trees, Soil profiles, Seepage, Litter, Microclimatology, Mulching, Water yield, *Utah, Soil texture, Sagebrush, Precipitation(Atmospheric), Subsurface flow.
Identifiers: *Chaining, Windrowing, Woodlands, Moisture flux.

Differences in soil moisture patterns were studied under sites that were chained-with-debris-windrowed, and a natural pinyon-juniper woodland. Soil moisture accumulation was greatest under sites with debris-in-place, and the least under natural woodlands. Soil moisture pattern differences are the result of microclimatic changes due to chaining, mulching effect of litter from the debris-in-place treatment, different rooting depths, length of growing season, and snow accumulation differences. Vegetation density variability on the chained sites did not affect soil moisture patterns. There was no evidence of deep seepage on any treated sites. (Mastic-Arizona)

FERRUGINOUS CONCRETIONS IN A POORLY DRAINED SOIL OF ALBERTA,
Alberta Univ., Edmonton.
S. Pawluk, and J. Dumanski.
Soil Sci Soc Am Proc. Vol 37, No 1, p 124-127, 1973. Illus.
Identifiers: Albaqualf, *Canada(Peace River), *Concretions(Ferruginous), *Iron oxides, Sideric, X-Ray, Drainage, Minerals, Maghemite, Acid shales, *Soils(Magnetic properties).

Investigations into the nature of a poorly-drained soil pedon developed from acid shales in the Peace River region of Alberta, Canada, revealed the presence of ferruginous concretions in the A and B horizons. Concretions from both horizons were separated into 2 groups, magnetic and nonmagnetic. Magnetic properties were attributed to the presence of maghemite. This mineral was associated with iron oxides amorphous to X-rays in the A horizon and with hematite in the B horizon. Iron oxide in nonmagnetic concretions from the A horizon was X-ray amorphous while that in the B was crystallized as both goethite and hematite. Magnetic concretions from the A horizon showed dense areas when viewed in thin-sections and contained less organic matter and oxalate extractable iron than the associated nonmagnetic concretions. An authigenic origin is suggested for the concretions.--Copyright 1973, Biological Abstracts, Inc.

REPRODUCTIVE CHARACTERISTICS OF THE CUI-UI LAKESUCKER (CHASMISTES CUJUS COPE) AND ITS SPAWNING BEHAVIOR IN PYRAMID LAKE, NEVADA,
Nevada Univ., Reno. Dept. of Biology.
D. L. Koch.
Trans Am Fish Soc. Vol 102, No 1, p 145-149. 1973.
Identifiers: Behavior, Chasmistes-cujus, *Cui-ui lakesucker, Eggs, Lakes, *Nevada(Pyramid Lake), Parasitism, Saprolegnia, *Spawning, *Reproduction(Lakesucker).

Pyramid Lake, Nevada, provides suitable habitat for adult cui-ui, but becomes limiting for the development and hatching of the eggs. The continued diversions of the Truckee River have eliminated access to ancestral spawning areas by the cui-ui. The diversions of the river have also caused a decline in the level of Pyramid Lake which is becoming more limiting to the cui-ui as ion concentrations increase. During 1971, cui-ui were observed spawning in Pyramid Lake for the first time. Cui-ui males and females can be easily distinguished in the breeding condition. The males are smaller than the females and are densely covered with pearl organs. The females are more robust than the males and do not exhibit a pinkish lateral stripe present on the males. The spawning sites are in clear, cool waters and have bottom gravel fine to coarse in texture. These sites are located near tributary streams where bottom gravels are clean. One female is attended by 2-6 males during the spawning act, and she spawns 4-5 times before returning to deep water. Cui-ui spawning is marginal at best in Pyramid Lake due to heavy predation by cui-chubs on the fertilized eggs and parasitism on the eggs by the fungus Saprolegnia sp. Thus, efforts should and are being made to artificially propagate this species before its ultimate extinction under present conditions.--Copyright 1973, Biological Abstracts, Inc.

THE BIOLOGY OF MYSIDS ACCLIMATIZED IN THE RESERVOIRS OF THE VOLGA RIVER,
Akademiya Nauk SSSR, Tolyatti. Institut Biologii Vnutrennykh Vod.
N. D. Borodich, and F. K. Havlena.
Hydrobiologia, Vol 42, No 4, p 527-539, September 28, 1973. 4 fig, 5 tab, 20 ref.

Descriptors: *Systematics, Habitats, Environment, Reservoirs, Light intensity, Migration, Reproduction, Behavior, Adaptation, Distribution patterns, *Shrimp, *Crustaceans.
Identifiers: *Mysids, *Opossium shrimp, Macroinvertebrates, *USSR(Volga River).

Mysides were successfully introduced and acclimatized in the artificial reservoirs of the Volga River. They live there in the shallow sandy areas and their numbers amount to 300-500 ind/sq m. They avoid direct sunlight, make slight vertical migrations according to the light intensity; during the morning hours their maximum is at the depth 0.2 m, at noon in 0.1-1.5 m. It has been proved that their biological features in the new localities do not differ from those in the original localities. (Mortland-Battelle)

VERTICAL DISTRIBUTION OF TRANSPARENCY IN LAKE BAIKAL AND ITS RELATIONSHIP TO BIOLOGICAL INDICES, (IN GERMAN),
P. P. Sherstyankin, V. M. Kaplin, and V. N. Maksimov.
Gidrobiol Zh. Vol 8, No 4, p 65-68, 1972. Illus.
Identifiers: *Lake Baikal, Biological indicies, Cyclotrichium-brunneum, Didinium-nasutum, *Distribution(Vertical), Epischura-baicalensis, Gymnodinium, Indices, Lakes, *Transparency, USSR.

Vertical changes in transparency (index of the reduction of parallel light), temperature, pH and the vertical distribution of 13 species of zoo-, phyto- and microbial plankton, including Epischura baicalensis, Didinium nasutum, Cyclotrichium brunneum and Gymnodinium were analyzed. The transparency was measured by a photometer-transparency meter in 6 regions of the spectrum from UV to red. The layer with the maximum index of transparency corresponded to that with maximum biological indices. The UV portion of the spectrum was most sensitive to different substances in the water such as dissolved organic matter and suspended particles compared to other portions. Changes in the transparency index could be used to show horizontal and vertical distribution of plankton.--Copyright 1973, Biological Abstracts, Inc.

PLANKTON OF THE 'OZERO AYATSKOYE' RESERVOIR AS FODDER BASE FOR COREGONIID FISH, (IN RUSSIAN),
I. V. Kozlova.
Gidrobiol Zh. Vol 8, No 5, p 42-51, 1972. Illus. (English summary).
Identifiers: Biomass, Consumption, *Coregoniid fish, Hydrology, *Plankton, Reservoir, *USSR(Ozero Ayatskoye reservoir), Fish foods.

The composition, number and biomass dynamics of animal plankton in the Ozero Ayatskoye, USSR, is shown, with reference to hydrological condition changes. The high importance of pH is established. Within a year (except May), the peaceful forms are dominant in the plankton (56.5-90%). The intense consumption, over a year, by planktonophagous and polyphagous (and benthophagous) fishes affected the fodder capacity of the lake, so at the end of Feb. planktonic organisms became close to extinction.--Copyright 1973, Biological Abstracts, Inc.

OBSERVATIONS ON WATER FLEAS (CLADOCERA) IN THE TROUT POOLS AT THE BIOLOGICAL STATION LUNZ (LOWER AUSTRIA),
Z. Stromenger.
Pol Arch Hydrobiol. Vol 19, No 3, p 291-301, 1972. Illus.
Identifiers: Alona-affinis, Alona-costata, Alona-guttata, *Austria, Biological studies, Ceriodaphnia-quadrangula, Chydorus-sphaericus, Cladocera, Scapholeberis-mucronata, Simocephalus-vetulus, *Water fleas, *Crustaceans, *Fish pools.

Observations were made in 4 subalpine shallow trout pools which were connected by dams, and contained continuously flowing cool clear water. A total 7 Cladocera species were found in the pools: Chydorus sphaericus, Simocephalus vetulus, Scapholeberis mucronata, Alona affinis, A. guttata, A. costata and Ceriodaphnia quadrangula. The first 3 were the most frequent. Species and individual count were much lower for these pools than in carp pools of the Central European lowlands. The Cladocera were particularly frequent in warm sunny positions between bank and underwater plants. C. sphaericus is most frequent in the end of Aug. and beginning of Sept. At this time numerous males and ephippial females occur.--Copyright 1973, Biological Abstracts, Inc.

ESTIMATING ACCURACY FOR CALCULATING PRODUCTION AND ELIMINATION OF PLANKTONIC CRUSTACEANS USING EUDIAPTOMUS GRACILIS IN LAKE KRASAVITSA AS AN EXAMPLE, (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
M. B. Ivanova.
Zool Zh. Vol 52, No 1, p 111-120, 1973. Illus. (English summary).
Identifiers: *Crustaceans, Density, Eudiaptomus-gracilis, Lakes, *Planktonic populations, *USSR(Lake Krasavitsa), *Productivity.

The population of planktonic crustaceans can be considered as a stationary one if the population density of individual ages is assumed as the average year density weighed by the time of their presence in the plankton. The average diurnal production and elimination for such a stationary population can be calculated. The production of the E. gracilis population by average diurnal increases was determined, as well as the diurnal elimination both for individual ages and total by the rate of population recruitment. In the case of stationary population, all 3 methods give the same results (P = 47.16 mg/m sq/1 day at the biomass of 515.59 mg/m sq). The relative mortality proved to be constant (d = 0.0782), i.e. in the lake under study no preferential elimination of any age of E. gracilis was observed. On some examples, the diurnal production, rate of biomass accumulation and G/W-coefficients were shown to depend on the character of viability curve. Standard errors were calculated for different methods of calculation. The error was the least when calculating production by diurnal increases. To decrease the scatter of calculated production, special attention is paid to the accuracy in estimating the numbers of animals.--Copyright 1973, Biological Abstracts, Inc.

WATER EXCHANGE IN LAKE BAYKAL (O VODOOBMENE V OZ. BAYKAL),
Institute of Geography of Siberia and the Far East, Irkutsk (USSR).
V. I. Verbolov, and M. N. Shimarayev.
Institut Geografii Sibiri i Dal'nego Vostoka Doklady, No 36, p 41-47, Irkutsk, 1972. 1 fig, 2 tab, 19 ref.

Descriptors: *Lakes, *Currents(Water), *Water circulation, *Movement, Velocity, Water balance, Inflow, Discharge(Water), Tritium, *Spatial distribution.
Identifiers: *USSR(Lake Baykal), Water exchange.

Basic characteristics of horizontal and vertical movements in Lake Baykal are examined. Estimates are made of the extent of water exchange caused by horizontal currents, and analysis of water exchange between morphologically independent parts of the basin is based on data on spatial distribution of water-balance items in the lake and of natural tritium. The time required for lake waters to be replaced by river waters is about 500 years for the northern part of the lake, 250 years for the middle part, and 90 years for the southern part. The rate of vertical circulation in the area of slopes is estimated at 0.01-0.1 cm/sec. The time required for complete exchange of surface and deep waters is about 11 years. (Josefson-USGS)

THE EFFECTS OF RESTRICTED CIRCULATION ON THE SALT BALANCE OF GREAT SALT LAKE, UTAH,
Geological Survey, Salt Lake City, Utah.
K. M. Waddell, and E. L. Bolke.
Utah Geological and Mineral Survey, Salt Lake City, Water-Resources Bulletin 18, December 1973. 54 p, 15 fig, 9 tab, 16 ref, append. Price: $3.00.

Descriptors: *Brines, *Lakes, *Water circulation, *Utah, *Great Salt Lake, *Computer models, Saline lakes, Evaporation, Water balance, Water quality, Mathematical models.

A digital computer model describing the brine movement through the causeway across Great Salt Lake, Utah was developed to predict the future trend of the salt balance between the two parts of the lake for the existing causeway and for modified culvert openings and various rates of inflow. During the 1970-1972 water years a net load of dissolved solids of 0.26 billion tons moved from the south to north part of Great Salt Lake through the causeway. The balance of dissolved-solids load in the lake for the existing causeway conditions depends principally upon the quantity of freshwater inflow to the lake. For simulated inflow rates resulting in rising stages, the net dissolved-solids load increased slightly in the south part during a 10-year period. If the rate of rise of lake stage is great enough, net load movement could be to the north part. If the lake stage drops at the simulated rate for a 10-year period, the net effect would be a loss of 0.27 billion tons of dissolved-solids load from the south to the north part and the deposit of 1.08 billion tons of sodium chloride in the north part. The salt balance in Great Salt Lake can be changed by increasing the number of culverts or by widening the culverts in the causeway. The width of culvert opening necessary to bring the lake near chemical equilibrium depends upon the inflow conditions and desired salt balance. A culvert width of 500 feet would be required to bring the dissolved-solids concentration in the south part to within about 85 percent of that in the north part and to limit precipitation of sodium chloride in the north part to less than 0.1 billion tons (for lake altitudes above 4,192 feet) for all the simulated inflow rates. A culvert width of 750 feet would be required to bring the dissolved-solids concentration in the south part to within about 90% of that in the north part. (Knapp-USGS)

WATER LILIES AS BEAVER FOOD.
Newfoundland Wildlife Service, St. John's.
T. H. Northcott.
Oikos. Vol 23, No 3, p 408-409, 1972.
Identifiers: *Beaver food, Nuphar-microphyllum, Nuphar-variegatum, *Water lilies, *Canada(Newfoundland), Ponds.

Water lily (Nuphar microphyllum, N. variegatum) roots as potential food supply for beavers were investigated in an area of central Newfoundland. The geology and topography of the pond bottom often make the lily roots inaccessible to beavers. An abundance of lilies in a pond does not necessarily imply an abundance of root food for the beaver.--Copyright 1973, Biological Abstracts, Inc.

NEW COMPLEXITIES IN ZOOGEOGRAPHY AND TAXONOMY OF THE PYGMY WHITEFISH (PROSOPIUM COULTERI),
Manitoba Univ., Winnipeg. Dept. of Zoology.
C. C. Lindsey, and W. G. Franzin.
J Fish Res Board Can. Vol 29, No 12, p 1772-1775. 1972. Illus.

Identifiers: *Canada(Elliott Lake), *Prosopium-coulteri, Records, Taxonomy, *Whitefish, Zoogeography, Lakes.

Pygmy whitefish (P. coulteri) are recorded for the first time from the Peel-Mackenzie river drainage (Elliott Lake, Yukon Territory) and from the Hudson Bay drainage (Waterton Lakes, Alberta, in the South Saskatchewan-Nelson river system)(Canada). The morphology of specimens from both localities contradicts the previously known pattern of a southeastern 'low-rakered' and a northwestern 'high-rakered' form (with the 2 forms occurring sympatrically in some lakes of the Bristol Bay area). Specimens from Elliott Lake, the most northerly known locality, resemble the southeastern form and those from Waterton Lakes the northwestern form. Both Waterton and Elliott lakes lie close to unglaciated refugia, suggesting that the species may have survived Wisconsin glaciation and diverged in several different watersheds.--Copyright 1973, Biological Abstracts, Inc.

GROWTH , LIFE HISTORY, AND RESPIRATION OF MYSIS RELICTA IN AN ARCTIC AND TEMPERATE LAKE,
Trent Univ., Peterborough (Ontario). Dept. of Biology.
D. C. Lasenby, and R. R. Langford.
J Fish Res Board Can. Vol 29, No 12, p 1701-1708. 1972. Illus.
Identifiers: *Arctic lakes, *Canada(Char Lake-N.W.T.), *Growth rates, Lakes, *Mysis-Relicta, *Respiration, Temperate lakes, Life cycle, Aquatic animals.

M. relicta from Char Lake (N.W.T.) (Canada) take 2 yr to reach maturity, retaining 36 cal as net production; those from Stony Lake (southern Ontario) (Canada) mature in 1 yr, retaining 53 cal as net production. Growth rates were highest during summer months for individuals in both lakes. Results of respiration experiments at 0, 2, 4, 6, and 8C for Char Lake mysids and at 2, 4, 7, 10, and 13C for Stony Lake mysids were not significantly different, indicating that M. relicta demonstrates no metabolic compensation over its environmental temperature range. Generalized energy budgets were constructed for individuals from each population for their entire life-span. A female uses approximately 209 cal for growth and respiration to become a reproducing adult in 1 yr in Stony Lake and approximately 206 cal to become a reproducing adult in 2 yr in Char Lake.--Copyright 1973, Biological Abstracts, Inc.

DIVERSITY AND LONGITUDINAL ZONATION IN FISH POPULATIONS OF TWO STREAMS ENTERING A METROPOLITAN AREA,
Toledo Univ., Ohio. Dept. of Biology.
E. J. Tramer, and P. M. Rogers.
The American Midland Naturalist, Vol 90, No 2, October 1973, p 366-374. 1 fig, 3 tab, 11 ref.

Descriptors: *Systematics, *Fish populations, *Distribution patterns, Freshwater fish, Water pollution effects, Depth, Streams, Sampling, Habitats, Carp, Catfishes, Perches, Sunfishes, Pikes, Shiners, Suckers, Correlation analysis, Fish populations, *Ohio.
Identifiers: *Data interpretation, Species diversity, Habitat diversity, Substrates.

The distribution and relative abundance of fishes were surveyed in Swan and Tenmile creeks, Lucas Co., Ohio, from their headwaters in a rural agricultural area to points near the center of the city of Toledo, Ohio. Twenty-one species were found in each creek. Of the total of 27 species collected only two, Semotilus atromaculatus and Notropis stramineus, occurred at each sample station. Species diversity along both streams followed no definite pattern, even when the creeks became grossly polluted, since declines in the number of species present were often offset by shifts toward relative abundances which were more evenly distributed. Fush species diversity was not correlated with an index of habitat diversity. Furthermore, unlike other longitudinal zonations, diversity was not correlated with mean depth of the stream or with distance from the headwaters, and species composition changes took the form of replacements rather than additions to the headwaters assemblage. Pollution stress cancelled out the effects of factors such as substrate diversity and mean depth, thereby obliterating the normal patterns of diversity and longitudinal zonation. (Mortland-Battelle)

THE TRAPPING OF AQUATIC HYPHOMYCETE SPORES BY AIR BUBBLES,
Exeter Univ. (England). Dept. of Biological Sciences.
S. H. Iqbal, and J. Webster.
Trans Br Mycol Soc. Vol 60, No 1, p 37-48. 1973. Illus.
Identifiers: *Air bubbles, *Anguillospora-Crassa, *Aquatic hyphomycete, Detergents, *Spores, Trapping, *Varicosporium-Elodeae.

A technique is described for estimating the rate of removal of aquatic hyphomycete spores from suspension by air bubbles, and for calculating the trapping efficiency of an air bubble. Values for trapping efficiency are given for different kinds of hyphomycete spore. In general, the branched type of spore is more readily removed from suspension than spores of conventional shape, although the trapping of the sigmoid spores of Anguillospora crassa is quite effective. Evidence is presented for Varicosporium elodeae that as the complexity of branching of the spore increases, the effectiveness of trapping by air bubbles also increases. The addition of detergent causes an increase in the rate of removal of spores.--Copyright 1973, Biological Abstracts, Inc.

CAN HALOBATES DODGE NETS. I: BY DAYLIGHT.,
Scripps Institution of Oceanography, La Jolla, Calif.
L. Cheng.
Limnology and Oceanography, Vol 18, No 4, p 663-665, July 1973. 1 fig, 2 tab, 8 ref.

Descriptors: *Insects, *Zooplankton, Surface waters, *Light, *Environmental effects, Diurnal, Oceans, Water sampling, Plankton nets, Biorhythms, *Nets.
Identifiers: *Halobates spp, Ocean striders, Hemiptera.

The genus Halobates comprises oceanic insects closely related to the pond-skaters of freshwater lakes and streams; they are the only insects known to live in the open ocean. Evidence is presented for active net avoidance by ocean-striders, based on analyses of catch data. The Halobates samples studied were all collected by horizontal surface plankton hauls. A circular net, 1 m in mouth diameter, was towed half-submerged on one side of the ship, for about 20 min at a speed of 2.5-3.5 km/hr, thus covering an area of about 1,000 sq m during each tow. A total of 1,649 surface samples were examined for Halobates; half (822) were collected during the day (between 0600 and 1800 hours) and the others at night. A comparison was made of the percentages of positive catches by day and by night. The monthly mean positive percentage was 16.3 among day samples, among night samples it was 40.3. The relatively lower numbers of Halobates collected during daylight hours can be attributed to visual avoidance of the net. The data suggest that in the daytime Halobates can see and tend to avoid approaching nets. Consequently, population densities of these insects, based on daytime samples, may be underestimated by a factor of 2 or 3. (See also W74-06118) (Mortland-Battelle)

Limnology and Oceanography, Vol 18, No 4, p 666-669, July 1973. 5 fig, 1 tab, 3 ref.

Descriptors: *Insects, *Zooplankton, *Light, *Insect behavior, *Environmental effects, Surface waters, Diurnal, Oceans, Plankton nets.
Identifiers: *Halobates spp, *Lunar periodicity, Ocean striders, Lunar phases, Hemiptera.

Evidence has been presented that ocean-skaters (Halobates) are able to avoid surface plankton nets towed during daylight hours. Only night samples collected between 1800 and 0600 hours were considered. They comprised 2,712 animals, caught in 827 samples taken on 333 days during 16 sequential calendar months. A breakdown of resultant data indicates that Halobates may have been better able to avoid the net during full moon: the insects were found in 38 percent of all samples taken around new moon, but in only 24 percent of samples taken during full-moon nights. A statistical test of the totals supports the interpretation that this difference is significant but such testing is not entirely appropriate because of the conspicuous heterogeneity in the data. Therefore, further

analyses were undertaken, involving periodograms. The three periodograms clearly indicate the expected lunar and bilunar peaks. None of these analyses can provide rigorous and irrefutable evidence for a lunar periodicity in the available data. Nevertheless, the internal consistency of the periodogram analyses as well as the biological plausibility of the apparent phase relationship with the moon support the initial hypothesis that Halobates may, indeed, be able to see an approaching net by the light of the moon, and on moonlight nights to dodge it more successfully than in darkness. FIRST RECORDS OF THE CHINESE MITTEN CRAB, ERIOCHEIR SINENSIS, (CRUSTACEA:BRACHYURA) FROM NORTH AMERICA,
Lake Erie Fisheries Research Station, Wheatley (Ontario).
S. J. Nepszy, and J. H. Leach.
Journal of the Fisheries Research Board of Canada, Vol. 30, No. 12, Pt. 1, p 1909-1910, December 1973. 5 ref.

Descriptors: *Lake Erie, *Crustaceans, *Crabs, Aquatic animals, Invertebrates, Spatial distribution, Gill nets.
Identifiers: *Chinese mitten crab, Detroit River, Macroinvertebrates, Eriocheir sinensis.

Three specimens of the Chinese mitten crab, Eriocheir sinensis H. Milne Edwards, were captured commercially by gillnets in Lake Erie in April and May, 1973. Also, a specimen was collected from a water-intake pipe opposite Belle Isle in the Detroit River at Windsor, Ontario in October, 1965. The crab, a catadromous species with a thick mass of hair on each of the chelipeds, is indigenous to the low-lying areas of northern China and as far south as Shanghai. In Europe, where it was found in 1912 in a tributary of the Weser River in Germany, it has spread to the south of France and is spreading to low-lying areas of Germany, Scandinavia, Holland, and Belgium. Presumably the crabs were carried to Lake Erie in ballast tanks of a ship or ships. The crab is a serious pest in Europe, where it causes erosion of river banks because of its burrowing habit. It damages nets, eats bait and netted fish, and reduces potential fish food. Though the crab is unlikely to become established in Lake Erie or the upper Great Lakes, accidental introduction to an estuarine system might permit it to become established in North America. (Mortland-Battelle)

INLAND WATERS, VOL 16, PART 6. FRESHWATER PHYTOPLANKTON. SYSTEMATICS AND BIOLOGY, (IN GERMAN),
G. Huber-Pestalozzi.
E. Schweizerbart'sche Verlagsbuchhandlung: Stuttgart, West Germany, 1972. 116 p, Illus.
Identifiers: Asterococcaceae, Bibliographies, *Biology, Publications, Chaetochloridaceae, Characiosiphonaceae, Chlorangiellaceae, Cytology, Distribution, Ecology, Fresh, Gloeococcaceae, *Inland waters, Nautococcaceae, *Pytoplankton, Prasinocladaceae, Reproduction, *Systematics, *Tetrasporaceae.

This monograph presents a revision of the planktonic and benthic freshwater tetrasporales of the world. A total of 8 families (Gloeococcaceae, Asterococcaceae, Chlorangiellaceae, Chaetochloridaceae, Tetrasporaceae, Nautococcaceae, Characiosiphonaceae, Prasinocladaceae), 44 genera and 124 spp. are described. Keys for the determination of the families, genera and species are given. Geographical data are included for the species. Morphology and cell structure, reproduction, occurrence and ecology are discussed. A bibliography, subject and author indexes and an extensive number of illustrations are included.--Copyright 1973, Biological Abstracts, Inc.

INFLUENCE OF DEVELOPMENT IN VICIA VILLOSA AND VICIA SATIVA BY THEIR NODULES AND BY CLIMATIC CONDITIONS: I. DEVELOPMENT OF NODULES IN VICIA VILLOSA AND IN VICIA SATIVA DURING VEGETATIVE PERIOD, (IN GERMAN),
Deutsche Akademie der Landwirtschaftswissenschaften zu Berlin, Rostock (East Germany). Institut fuer Pflanzenzuechtung.
H. Risch.
Biochem Physiol Pflanz (BPP). Vol 162, No 6, p 538-546, 1971. Illus. (English summary).
Identifiers: Climatic, Flowering, *Nodules, Vegetative period, *Vicia-sativa, *Vicia-villosa.

In humid summers, V. villosa did not finish development, produced a luxuriant green mass and a high rate of flowers. Fruit and seed production were low, but the mass of active nodules was extraordinarily high. Older nodules were able to sprout giving a rise to new active nodules. Independent of the climatic conditions V. sativa completed development. Only a few flowers were formed, but seed production was very high. Sprouting of nodules was never observed. Nodules decline and reduction in the number and mass of the nodules begins with fruiting. The tendency of branching in the nodules of V. villosa increased with increasing soil moisture. The morphology of nodules of V. sativa remained unchanged. Soil moisture had no influence on flowering time in V. sativa.--Copyright 1973, Biological Abstracts, Inc.

STOMATAL RESPONSES TO CHANGES IN HUMIDITY IN PLANTS GROWING IN THE DESERT,
Wuerzburg Univ. (West Germany). Botanisches Institut II.
E. D. Schulze, O. L. Lange, U. Buschbom, L. Kappen, and M. Evenari.
Planta (Berl). Vol 108, No 3, p 259-270, 1972. Illus.
Identifiers: Apricot, Deserts, Hammada-scoparia, *Humidity, Prunus-armeniaca, Soils, *Stomatal response, Zygophyllum-dumosum, *Negev Desert, Xeromorphic plants, Mesomorphic leaves.

The stomata of plants growing in the Negev Desert, namely the stomata of the mesomorphic leaves of Prunus armeniaca, the xeromorphic stems of Hammada scoparia, and the succulent leaves of Zygophyllum dumosum, respond to changes in air humidity. Under dry air conditions diffusion resistance increases. Under moist air conditions diffusion resistance decreases. When the stomata close at low air humidity the water content of the apricot leaves increases. The stomata open at high air humidity in spite of a decrease in leaf water content. This excludes a reaction via the water potential in the leaf tissue and proves that the stomatal aperture has a direct response to the evaporative conditions in the atmosphere. In all species the response to air humidity is maintained over a period of many hours when the soil is considerably dry. The response is higher in plants with poor water supply than in well watered plants. Thus for field conditions and for morphologically different types of photosynthesizing organs the results confirm former experiments carried out with isolated epidermal strips.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF WATER DEFICIENCY AND LIGHT REGIME ON PHOTOSYNTHETIC ACTIVITY OF LEAVES, (IN RUSSIAN),
Akademiya Nauk Estonskoi SSR, Tartu. Institut Fiziki i Astronomii.
Kh. A. Moldau.
Fiziol Rast. Vol 19, No 6, p 1139-1145, 1972. Illus. (English summary).
Identifiers: *Betula-verrucosa, *Goutweed, *Hazelnut, Leaves(Water deficiency), Light regime, *Lily-of-the-Valley, Stomata, Mesophyll, *Photosynthesis, Primula-veris, Herbaceous plants.

The effect of water deficiency and light regime on the mesophyll and stomatal conductivity was studied with the leaves of woody and herbaceous plants (lily-of-the-valley) Primula viris, goutweed, hazelnut and Betula verrucosa in a deciduous forest. The measurements were carried out in a conditioned single-leaf chamber at a constant (saturating) light intensity and CO2 deficiency. The mesophyll conductivity did not depend on water potentials in the leaves within the range from -2.5 to -18.0 bars. Inhibition of the intensity of photosynthesis within this range was due only to a decrease in the stomatal conductivity. A gradual adaptive increase of the mesophyll conductivity was registered in the leaves from shaded plants exposed to the full sunlight. In the course of this adaptation the shaded plants acquired the properties of the light plants. More rapid changes in the mesophyll conductivity, reflecting the light regime of the plant during previous shorter periods of time, were discernible.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF ILLUMINATION AND WATER TEMPERATURE ON CRITICAL FLOW RATES FOR FISH, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Inst. of Evolutionary Morphology and Animal Ecology.
D. S. Pavlov, Yu. N. Sbikin, A. E. Vashchinnikov, and A. D. Mochek.
Vopr Ikhtiol. Vol 12, No 4, p 769-778, 1972. Illus.
Identifiers: Acipenser-guldenstadti, Acipenser-stellatus, Fish, Flow, Gobio-gobio, Leucaspius-delineatus, Nemachilus-barbatulus, Perca-fluviatilis, Rutilus-rutilus, Rutilus-rutilus-caspicus, Scardinus-erythrophthalmus, *Water temperature, *Fish vision, *Water tunnels.

The critical rate of flow in a water tunnel for Acipenser stellatus, A. guldenstadti, Rutilus rutilus, R. rutilus caspicus, Scardinius erythrophthalmus, Leucaspius delineatus, Gobio gobio, Nemachilus barbatulus and Perca fluviatilis was largely related to conditions of visual orientation. Changes in illumination had a particularly strong effect on fish in which the primary receptor was vision. For bottom fish with mainly tactile reception the critical rate at all levels of illumination was about the same. Changes in water temperature had a strong effect on the swimming ability of fish. The critical rate of flow reached a maximum at different temperatures for different species.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF DEHYDRATION ON ATPASE ACTIVITY IN POIKILOHYDROUS AND HOMEOHYDROUS PLANTS, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Inst. of Plant Physiology.
N. D. Pronina.
Fiziol Rast. Vol 19, No 4, p 863-864. 1972.
Identifiers: *Atpase, Atrichum-Undulatum, *Dehydration, *Homeohydrous plants, Nectria-crispa, Parmelia-aspera, Poikilohydrous plants.

ATPase activity during dehydration was determined in homogenate tissue of Nectria crispa L., Parmelia aspera Massal and Atrichum undulatum L. Insignificant dehydration stimulated ATPase activity in A. undulatum but further dehydration

(up to 16%) sharply decreased ATPase activity. Up to 70-87% and 60% of ATPase activity was retained in N. crispa and P. aspera, respectively, under similar conditions. ATPase activity was observed 3 min after watering N. crispa plant which had been kept in a dry state with 8.2% humidity for 8 mo.--Copyright 1973, Biological Abstracts, Inc.

MOISTURE STRESSES IN ARIZONA MIXED CONIFER SEEDLINGS,
Forest Service (USDA) Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
J. R. Jones.
USDA Forest Service Research Paper RM-86, April, 1972. 8 p, 5 fig, 13 ref.

Descriptors: *Moisture stress, *Coniferous forests, *Dry seasons, Moisture uptake, Soils, Soil moisture, Moisture deficit, Regime, Root zone, Field capacity, *Arizona, Snowpacks, Photosynthesis, Douglas Fir trees, Ponderosa Pine trees, Diurnal.
Identifiers: *Seedlings, Pressure bomb.

Measured moisture stresses of various mixed conifer seedlings examined in Arizona during the dry season showed that dry season effects were not as severe as commonly thought, with no measurements approaching what the literature defines as critical. No severe moisture stresses were found in planting stock-sized seedlings. In other areas with similar moisture regimes, drought is not a major factor in seedling survival, and in pines, not even in the first dry season, except where there is heavy grass cover. Knowledge of plant moisture stress may be used in modeling of moisture regimes, or used to test and/or modify vegetation or physiographic site types. (Mastic-Arizona)
W74-06461

SOIL MOISTURE RESPONSE TO SPRAYING BIG SAGEBRUSH THE YEAR OF TREATMENT,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
D. L. Sturges.
Journal of Range Management, Vol 26, No 6, p 444-447, November 1973. 3 fig, 1 tab, 6 ref.

Descriptors: *Soil moisture, *Sagebrush, *Spraying, *2,4-D, *Herbicides, Water yield, Range management, Root zone, Moisture meters, *Wyoming, Plant growth, *Chemcontrol.

Chemical control of sagebrush is becoming a chief management practice for improving rangeland production. Soil moisture loss was reduced 24% after spraying big sagebrush with 2,4-D in Wyoming between June 24 and September 30. Eighty-three percent of the reduction was located in soil 2 to 6 feet deep, due to the deep rooting characteristics of sagebrush. Results indicated that spraying can have a pronounced effect on the soil moisture regime under similar conditions, and that the reduction in moisture depletion was concentrated into a short time interval while the vegetation was actively extracting water. (Mastic-Arizona)

SEASONAL WATER POTENTIAL CHANGES IN SONORAN DESERT SHRUBS IN RELATION TO TOPOGRAPHY,
Arizona State Univ., Tempe. Dept. of Botany.
W. L. Halvorson, and D. T. Patten.
Ecology, Vol 55, No 1, p 173-177, Winter 1974. 3 fig, 1 tab, 17 ref.

Descriptors: *Shrubs, *Seasonal, *Soil-water-plant relationships, *Variability, *Plant physiology, Soil moisture, Desert plants, Diurnal, Moisture stress, *Arizona.
Identifiers: Water potential, Pressure-bomb, *Sonoran Desert, Cave Creek(Ariz).

Water potential in desert shrubs was studied during a one year period in the Sonoran Desert near Cave Creek, Arizona. Soil moisture was monitored by Colman blocks, with particular attention being paid to maximum and minimum water potentials on a seasonal and diurnal basis. The desert shrub Triangle bursage showed the greatest response to soil moisture changes seasonally, and demonstrated the lowest potential (-85 bars). Flat-top eriogonum also showed a high degree of response. Shrubs showing moderate response were jojoba, creosotebush, and Krameria. Cercidium microphyllum exhibited only slight responses to changing conditions, but showed high water potential during all periods. (Mastic-Arizona)

INFLUENCE OF VARIOUS INITIAL MOISTURE CONTENTS ON DECAY OF SITKA SPRUCE AND SWEETGUM SAPWOOD BY POLYPORUS VERSICOLOR IN THE SOIL-BLOCK TEST,
Lovelace Clinic., Albuquerque, N. Mex.
C. A. Peterson, and E. B. Cowling.
Phytopathology. Vol 63, No 2, p 235-237, 1973.
Identifiers: Decay, Liquidambar-styraciflua, Picea-sitchensis, *Polyporus-versicolor, *Sitka spruce, Soils, *Sweet-gum sapwood, Tests, *Soil moisture, Tree decay.

Thin wafers of Sitka spruce (Picea sitchensis (Borg) Carr.) and sweetgum (Liquidambar styraciflua L.) wood were adjusted to moisture contents of 6, 40, 45, 50, 60, 75 and 116 (spruce) or 122% (sweetgum) and then incubated with P. versicolor in ASTM (American Society for Testing Materials) Standard soil-block chambers for 4 and 8 wk. Initial moisture content had no effect on rate of decay. Sitka spruce proved highly resistant to decay by P. vesicolor; sweetgum, highly susceptible. Moisture contents of test wafers decreased substantially after 4 wk, indicating that the atmosphere within the decay chambers was unsaturated. Increases in moisture content above the fiber saturation point apparently resulted from water of metabolism, and water moved into the test wafers through invading fungus mycelium.--Copyright 1973, Biological Abstracts, Inc.

GROWTH AND FOOD CONVERSION OF RAINBOW TROUT REARED IN BRACKISH AND FRESH WATER,
Skidaway Inst. of Oceanography Savannah, Ga.
T. Murai, and J. W. Andrews.
U S Natl Mar Fish Serv Fish Bull. Vol 70, No 4, p 1293-1295. 1972. Illus.
Identifiers: Brackish water, *Food conversion(Fish), Fresh water, *Growth, *Rainbow trout, Reared, Salmo-Gairdneri, Survival.

The fact that temperature was not constant in all groups of Salmo gairdneri precluded a conclusive comparison of the performance of rainbow trout in brackish and fresh water. Rainbow trout were converted from fresh to 30% salinity in a period of 9 days and were reared to market size at this salinity. Trout fingerlings averaging 60 g each were reared to 266 g in 21C fresh water with a rapid individual growth rate and an acceptable survival and food conversion rate. Survival and growth rates and food efficiencies were excellent for trout reared in brackish water at an average temperature of 13.5C.--Copyright 1973, Biological Abstracts, Inc.

FOOD HABITS AND FEEDING CHRONOLOGY OF THE BLACKBANDED DARTER, PERCINA NIGROFASCIATA (AGASSIZ), IN HALAWAKEE CREEK, ALABAMA,
Alabama Cooperative Fishery Unit, Auburn.
D. Mathur.
Trans Am Fish Soc. Vol 102, No 1, p 48-55. 1973. Illus.
Identifiers: *Alabama(Halawakee Creek), Chronology, Coleoptera, Crustacea, *Darters(Black-Banded), Diptera, Ephemeroptera, Feeding, *Food habits, Percina-Nigrofascita, Plecoptera, Trichoperta.

In Halawakee Creek, Alabama, P. nigrogasciata showed 2 distinct feeding peaks; one in the morning and a higher one in late afternoon. Immature forms of Diptera, Ephemeropters, and Trichoptera were dominant in the diet over the 24-hr period. Although these organisms were most abundant in drift during the night, most were eaten during day light. Daytime feeding peaks suggest that P. nigrofasciata are visual feeders. Daily ration varied from 2.6-4.9% of the body weight. Optimum temperature range from maximal feeding in natural habitat was 17-23C. Feeding rate was low or high, above or below this temperature range. The fish were highly insectivorous. Numerically and on the basis of percent frequency of occurrence dipteran larvae were on the most important item in the diet throughout the year. Ephemeropteran nymphs constituted the bulk of the food by weight. Trichopteran larvae ranked third in importance. Other items which were eaten occasionally included copepods, cladocerans, amphipods, isopods, coleopteran larvae, and plecopteran nymphs. An almost complete absence of terrestrial food items and detritus (mud, sand, and gravel) and dominance of drift organisms in the diet organisms in the diet suggests subsurface feeding.--Copyright 1973, Biological Abstracts, Inc.

PLANT MOISTURE STRESS PATTERNS IN EUROTIA LANATA AND ATRIPLEX CONFERTIFOLIA,
Sydney Univ. (Australia). School of Biological Sciences.
L. D. Love, and N. E. West.
Northwest Sci. Vol 46, No 1, p 44-51. 1972. Illus.
Identifiers: *Atriplex-Confertifolia, Diurnal, *Eurotia-Lanata, *Moisture stress(Plant), Patterns, Rainfall, Seasonal, *Utah(Curlew Valley), Weather.

Pressure bomb measurements of diurnal and seasonal plant moisture stress in E. lanata and A. confertifolia were made during the 1968 and 1969 growing seasons in Curlew Valley, Utah. Highest values were recorded in early to mid afternoons of the driest, hottest periods. Rainfalls of more than 8 mm generally resulted in immediate reduction of stress values. Differences in plant distribution patterns could not be explained by differences in plant moisture stress data.--Copyright 1973, Biological Abstracts, Inc.

A RE-EXAMINATION OF THE USE OF THE SILT/CLAY RATIOS AS INDICATORS OF SEDIMENTARY ENVIRONMENTS: A STUDY FOR STUDENTS,
Bedford Inst., Dartmouth (Nova Scotia). Atlantic Geoscience Center.
B. R. Pelletier.
Maritime Sediments, Vol 9, No 1, p 1-12, April 1973. 11 fig, 3 tab, 22 ref.

Descriptors: *Silts, *Clays, *Sedimentology, Sedimentation, Sediment transport, Stratigraphy, Deposition(Sediments), Particle Size.
Identifiers: *Silt-clay ratio.

The silt/clay ratio may be used for the purpose of distinguishing aqueous environments of deposition providing the following interrelationship are understood: nature and availability of material at the source area; distance from source area; depth of water; energy available at the site of deposition; and the action of electrolytes in seawater as well as other chemical, biochemical and organic processes. Generally the silt/clay ratio is higher in the marine environment than in the lacustrine, due mainly to the action of electrolytes on suspended sediments in the sea. However in deep marine waters, the silt/clay ratios have the same low values as those for sediments in the much shallower lacustrine bodies. In the lacustrine and marine environment the silt/clay ratio generally decreases with a decrease in the mean size of sediment, increasing remoteness from shore, increasing water depth, and decreasing hydrodynamic vigor. EFFECTS OF MEANDERING ON SEDIMENT DISCHARGES AND FRICTION FACTORS OF ALLUVIAL STREAMS,
Iowa Univ., Iowa City. Dept. of Mechanics and Hydraulics.
Y. Onishi.
Available from the National Technical Information Service as PB-230 946 $12.00 in paper copy, $1.45 in microfiche. Ph D Thesis, December 1972. 158 p, 37 fig, 3 tab, 27 ref, 2 append. OWRR A-029-IA (4).

Descriptors: *Sediment transport, *Meanders, *Alluvial channels, Suspended load, Bed load, Channel morphology, *Sediment discharge, Flumes, Hydraulic models, Turbulent flow, Hydraulics.

The effects of channel meandering and of width of sinuous streams on the sediment loads and the friction factors of the flows were studied in flume experiments. Thirteen triplets of experiments were conducted in the subcritical flow domain in one straight and two meandering laboratory channels with sand beds and rigid walls. In each run, measurements were made of water-surface profiles, bed elevations, and total sediment discharge. In addition, detailed measurements of the distributions of the magnitude and direction of the local velocity and of suspended sediment concentration were made in two of the meandering-channel experiments. For given flow conditions, the sediment discharge per unit width in the full-width meandering channel is greater than that in the straight flume, which in turn is greater than in the half-width meandering channel. This is mainly due to the opposing effects of secondary circulation on the entrainment and suspension of sediment, and the nonuniform distribution of the unit discharge across the channel. The bend-loss coefficient increases with Froude number, the ratio of bed hydraulic radius-median sand diameter, and the ratio of width-centerline radius of curvature. This variation of bend-loss coefficient is primarily due to the bedform drag exerted on the point bar, and is probably modified by alteration of small-scale bed forms and by the modification of velocity distribution across the channel due to secondary flow. The enlargement of the point bars with increasing channel width may result from the increased velocity near concave walls, which in turn is due to the increased depth in this region produced by secondary circulation. BEACH FORESHORE SEDIMENTOLOGY AND MORPHOLOGY IN THE APOSTLE ISLANDS OF NORTHERN WISCONSIN,
California State Univ., Fullerton. Dept. of Geography.
W. N. Engstrom.
Journal of Sedimentary Petrology, Vol 44, No 1, p 190-206, March 1974. 6 fig, 2 tab, 48 ref.

Descriptors: *Beaches, *Sedimentation, *Wisconsin, Gravels, Sands, Particle size, Particle shape, Sediment sorting, *Regression analysis, Sediment transport, Statistical methods, *Lake Superior.
Identifiers: *Apostle Islands(Wisc).

Foreshore sediments and slopes of 39 beaches in the Apostle Islands of northern Wisconsin are related to wave energy, wave steepness and offshore slope. Stepwise regression analysis was used to link the response variables with the process variables. Wave parameters were hindcast using the S-M-B wave hindcasting procedure and were also inferred from foreshore morphology. Mean grain size of the foreshore sediments is weakly related to the process variables and is primarily a function of local source materials. Sorting of the sediments shows a strong positive relationship with the percentage of gravel in the sample and a weak positive relationship with angle of wave approach and wave height. Weakly negatively skewed sediments are associated with high energy and strong longshore movement which flatten and coarsen the foreshore, serving to weaken the winnowing effect of backwash and increasing the degree of trapping of fines. Low energy situations with a minimum of longshore drift operate to add finer material to the foreshore and thereby steepen it which facilitates the winnowing process, producing strongly negatively skewed sediments. More platykurtic grain-size distributions are associated with the relatively coarse-textured, less negatively skewed sediments of flatter foreshores while the more leptokurtic grain-size distributions typify the relatively fine-textured, more negatively skewed sediments characteristic of steeper foreshores. Foreshore slopes are related to mean grain size, wave energy and wave steepness. Steep foreshore slopes are associated with fine-textured sediments, suggesting the effects of constructive wave activity. Foreshore slopes are also generally inversely related to both wave steepness and wave energy. (Knapp-USGS)
W74-06281

SEDIMENTATION RATES AND RECENT SEDIMENT HISTORY OF LAKES ONTARIO, ERIE AND HURON,
Department of the Environment, Burlington (Ontario). Centre for Inland Waters.
A. L. W. Kemp, T. W. Anderson, R. L. Thomas, and A. Mudrochova.
Journal of Sedimentary Petrology, Vol 44, No 1, p 207-218, March 1974. 4 fig, 6 tab, 44 ref.

Descriptors: *Sedimentation rates, *Lake Ontario, *Lake Erie, *Lake Huron, Mercury, Sedimentation, Deposition(Sediments), Bottom sediments, Water pollution, Great Lakes, Land use, Soil erosion.

Sedimentation rates and changes in organic carbon, nitrogen, phosphorus and mercury concentrations were determined for 14 core locations, representing basins of fine-grained sediment in Lakes Ontario, Erie and Huron. Present-day sedimentation rates were high in Lake Erie, ranging from 847 to 5,049 g per sq m per yr, low to intermediate in Lake Ontario, ranging from 366 to 1,156 g per sq m per yr, and low in Lake Huron, ranging from 147 to 325 g per sq m per yr. There has been a threefold increase in sedimentation rate in Lake Erie since 1935 and the Kingston basin of Lake Ontario since 1930. The nutrient and Hg concentrations are enriched at the sediment surface in all the cores from Lakes Ontario and Erie, while the Huron cores show little change at the surface from their background concentrations. The enrichments are attributed to increased nutrient and Hg loading to the Ontario and Erie sediments, with the major increases after about 1950. The present-day loading of nutrients and Hg to the sediments parallels the rates of sedimentation at each location, being greatest in Lake Erie. Early-colonial loading of nutrients and Hg to Lake Ontario and Erie are generally similar to the modern loading of Lake Huron. The total loading of sediment, nutrients and Hg was estimated for each lake. Present-day sediment accumulation of 4,600,000, 23,400,000, and 3,900,000 metric tons was estimated for Lake Ontario, Erie and Huron, respectively. (Knapp-USGS)

DETERMINATION OF MONTMORILLONITE IN SMALL SAMPLES AND IMPLICATIONS FOR SUSPENDED-MATTER STUDIES,
Woods Hole Oceanographic Institution, Mass.
B. E. Tucholke.
Journal of Sedimentary Petrology, Vol 44, No 1, p 254-258, March 1974. 2 fig, 1 tab, 10 ref. NSF Grant GA24872.

Descriptors: *Montmorillonite, *X-ray diffraction, *Bottom sediments, Analytical techniques, Mineralogy, Oceanography.

The clay-size fraction of a deep-sea sediment sample from the western North Atlantic Ocean was analyzed for montmorillonite, illite, kaolinite and chlorite by X-ray diffraction of samples on silver filters. Samples with concentrations on the filters of less than about 1.6 mg per sq cm show an artificial depletion of montmorillonite or mixed-layer montmorillonite-illite and enrichment of illite relative to samples of higher concentrations. Calculated compositions of kaolinite and chlorite tend to remain constant at any concentration where these minerals are readily detectable. This is important for mineralogical studies of suspended particulate matter samples from the deep ocean, where samples with a total weight of only a few milligrams are normally recovered. X-ray diffraction analysis of such small samples may give the spurious results of montmorillonite-poor, illite-enriched particulate matter. (Knapp-USGS)

DETRITAL QUARTZ AS A NATURAL TRACER-FOURIER GRAIN SHAPE ANALYSIS,
Michigan State Univ., East Lansing. Dept. of Geology.
R. Ehrlich, J. J. Orzeck, and B. Weinberg.
Journal of Sedimentary Petrology, Vol 44, No 1, p 145-150, March 1974. 8 fig, 1 tab, 6 ref.

Descriptors: *Sands, *Beach erosion, *Particle shape, *Tracers, *Provenance, Statistical methods, Fourier analysis, Beaches, Alluvium, Quartz.

Quartz grain shape is a highly satisfactory natural tracer of sediment flux and accumulation. Sands from a river-beach-cliff complex near Oceanside, California, were analyzed in terms of the variation of the closed-form Fourier amplitude spectra of maximum projection shapes of about 100 grains per sample. The data were analyzed by hierarchical analysis of contingency tables and discriminant functions. River, beach, and cliff samples are clearly defined. At the end of the dry season, longshore drift had removed most of the sand of the San Louis Rey River from the beach, except at an area adjacent to a pier where at least 25% of sand grains were river-derived. During the dry season the unconsolidated beach cliff is the dominant source of beach sand. (Knapp-USGS)
W74-06293

CARBONATE CEMENTATION IN CORALLINE ALGAL NODULES IN THE SKAGERRAK, NORTH SEA: BIOCHEMICAL PRECIPITATION IN UNDERSATURATED WATERS,
Uppsala Univ. (Sweden). Dept. of Historical Geology and Paleontology.
T. Alexandersson.
Journal of Sedimentary Petrology, Vol 44, No 1, p 7-26, March 1974. 8 fig, 95 ref. Swedish NSRC Grant 3045-4.

Descriptors: *Coral, *Algae, *Atlantic Ocean, Carbonate rocks, Calcite, Carbonates, Chemical precipitation, Calcium, Magnesium, Sea water.
Identifiers: *North Sea(Skagerrak).

Carbonate sediments in the Skagerrak are affected by submarine dissolution which attacks skeletal grains of aragonite, Mg-calcite, and low-Mg calcite, and coarse detrital calcite in limestone clasts. Evidently, the sublittoral marine environment is undersaturated with calcium carbonate. Yet, in this environment, carbonate cement is forming in various kinds of openings within living coralline algal nodules (rhodoliths) consisting mostly of Lithothamnium. The internal cement is composed of aragonite needle cement, aragonite spherulitic cement, Mg-calcite fringe cement, Mg-calcite micrite, and Mg-calcite intraskeletal microdruses. Cement growth is related to metabolic activities in the living carbonate-secreting red algae. After death of the algae, the rhodoliths and their cement undergo dissolution. Biochemical influence of frame-building algae may be an important cause for internal cementation of reefs and algal crusts in the marine environment. (Knapp-USGS)

HELIUM ISOTOPES IN OCEAN SEDIMENTS (IZOTOPY GELIYA V OSADKAKH OKEANOV),
Akademiya Nauk SSSR, Leningrad. Fiziko-Tekhnicheskii Institut.
A. Ya. Krylov, B. A. Mamyrin, Yu. I. Silin, and L. V. Khabarin.
Geokhimiya, No 2, p 284-288, February 1973. 3 tab, 8 ref.

Descriptors: *Geochemistry, *Isotope studies, *Helium, *Sediments, Oceans, *Pacific Ocean, Atlantic Ocean, Clays.
Identifiers: USSR, Oozes.

The He-3/He-4 ratio in deep-sea red clays of the Pacific Ocean is large. The ratio in Atlantic red clays is also large but smaller by an order of magnitude than that for surface samples from the Pacific. The He-3/He-4 ratio in silty-pelite and sandy oozes near continents is the same as in rocks of the earth's crust. A large He-3/He-4 ratio in slowly formed deep-sea oozes is due to the presence of a large amount of meteoric material, which has a high He-3 content. The He-3/He-4 ratio in oozes may serve as an indicator of cosmic material and, hence, be useful in locating regions most favorable for finding remote transuranium elements of cosmic origin. (Josefson-USGS)

THE IONIUM-THORIUM METHOD OF DETERMINATION OF ABSOLUTE AGE AND RATE OF DEPOSITION OF BOTTOM SEDIMENTS (K VOPROSU OPREDELENIYA ABSOLYUTNOGO VOZRASTA I SKOROSTI SEDIMENTATSII DONNYKH OTLOZHENIY IONIY-TORIYEVYM METODOM),
D. S. Nikolayev, Ye. I. Yefimova, A. I. Il'in, and I. I. Shurko.
Geokhimiya, No 2, p 279-283, February 1973. 5 tab, 8 ref.

Descriptors: *Isotope studies, *Radioisotopes, *Bottom sediments, *Deposition(Sediments), *Sedimentation rates, Cores, Radiochemical analysis, *Atlantic Ocean.
Identifiers: USSR, *Ionium-thorium age method.

Radiochemical investigations were conducted in the Atlantic Ocean off the Gulf of Guinea to determine the age and deposition rate of bottom sediments. The depth distribution of Io and Ra concentrations in two bottom cores do not reflect the decay of these elements with time. The Th concentration varies unevenly with depth, increasing toward the lower part of the core and reaching the maximum value at a depth of 210-220 cm. Inconsistencies in absolute ages calculated for successive sediment layers are attributed to underwater slumping, thorium migration in the sediments, and to presence of continental or volcanic detrital materials containing large amounts of Io or Th. (Josefson-USGS)
W74-06308

ORIGIN AND DEVELOPMENT OF BEACH CUSPS AT MONTEREY BAY, CALIFORNIA,
Naval Postgraduate School, Monterey, Calif.
D. H. Smith.
Available from NTIS as AD-769 672 for $5.50 in paper copy. Master's thesis, September 1973. 63 p, 13 fig, 3 tab, 20 ref.

Descriptors: *Erosion, *Deposition, *Beaches, California, Beach erosion.
Identifiers: *Beach cusps, *Cusp formation, Sediment size, Monterey(Calif.), *Wave height, Breaker angle, Beach slope.

Beach cusps were observed daily on Del Monte Beach, California, and measurements obtained so that a quantitative description of the parameters which affect formation and size of cusps could be determined. In addition a theory of cusp formation was formulated and an insight obtained into the factors which influence the shape and size of cusps throughout their lifetime. Finally, the events leading to cusp destruction were examined. It was determined that beach cusps are depositional in nature, forming most easily in coarse, loose, sediment. Cusp development commences at a rise or area of accretion on the beach. A series of beach cusps forms sequentially rather than simultaneously. The width of beach cusps are a function of wave height; the larger waves producing wider cusp spacing. Uniform spacing of cusps in a series can be attributed to the same size waves striking the beach during the formation period of the cusps. Once formed, cusps are stable and tend to maintain their dimensions unless a large change in wave or beach condition occurs. (Sinha - OEIS)

THE KINEMATICS OF WATER PARTICLE VELOCITIES OF BREAKING WAVES WITHIN THE SURF ZONE,
Naval Postgraduate School, Monterey, Calif.
D. P. Richardson.
Available from NTIS as AD-769 423 for $5.00 in paper copy. Master's thesis, September 1973. 55 p, 19 fig, 1 tab, 12 ref.

Descriptors: *Waves(Water), *Surf, Measurement, Ocean waves.
Identifiers: Particle motion, *Particle velocities, Probability density functions, *Wave measurements, *Linear wave theory.

Simultaneous measurements of waves, and vertical and horizontal water particle velocities were made at the breaker-line within the surf zone using a capacitance type penetrating wave staff, a pressure wave gauge, and an electromagnetic current meter. Wave measurements were also made at seaward and shoreward locations. The wave energy-density spectral components were converted to velocity spectral components using linear wave theory. These computed values compared well qualitatively with the measured velocity spectra. Quantitatively, the results showed that linear theory underpredicted wave-induced horizontal velocity spectral components by about 50 percent at the frequency of peak energy. The coherence values between waves and horizontal velocity were high, ranging above 0.75. The phase angle computation showed the calculated velocity components leading the measured velocity components by an average of 20 degrees, indicating an unstable wave crest leading the particle motion in the body of the wave. Probability density functions were computed and compared to Gaussian and Gram-Charlier distributions using the chi-square goodness-of-Fit test. The Gram-Charlier

distribution qualitatively gave the better fit to the data. (Sinha - OEIS)

REMOTE SENSING OF OCEAN CURRENTS,
National Oceanic and Atmospheric Administration, Miami, Fla. Atlantic Oceanographic and Meteorological Labs.
G. A. Maul.
Available from NTIS as E73-10612 for $3.50 in paper copy. Interim Report for Period November 1972 - May 1973, Prepared for Goddard Space Flight Center, May 1973. 26 p, 4 fig, 10 ref.

Descriptors: Remote sensing, Currents(Water), Ocean currents, Color, Chlorophyll-a, Algae, Edge effect, Scattering.
Identifiers: ERTS imagery, Gulf of Mexico, Multispectral imagery, Sea state.

Monthly field experiments in support of the NOAA investigation of ocean color boundary determination using ERTS data have been conducted since June 1972. The boundary between coastal waters and the Loop Current has been detected by ERTS as a result of sea-state changes as well as color differences. Ocean information is contained in all 24 channels of the Bendix MSS flown on the C-130 in June 1972; this includes UV, visible, reflected IR and emitted IR. Computer enhancement of MSS data are revealing many features not shown in the NDPF product. Major ocean currents such as the Loop Current in the eastern Gulf of Mexico have surface manifestations which can be exploited for remote sensing. Surface chlorophyll-a concentrations, which contribute to the shift in color from blue to green in the open sea, were found to have high spatial variability; significantly lower concentrations were observed in the current. The cyclonic edge of the current is an accumulation zone which causes a peak in chlorophyll concentration. The dynamics also cause surface concentrations of algae, which have a high reflectance in the near infrared. Combining these observations gives rise to an 'edge effect' which can show up as a bright lineation on multispectral imagery delimiting the current's boundary under certain environmental conditions. Frequently the sea-state in the current is higher than in surrounding water due to differential shear. When high seas introduce bubbles, white caps, and foam, the reflectance is dominated by scattering rather than absorption. (Sinha - OEIS)

SPEED OF THE SOLITARY WAVE,
Hawaii Inst. of Geophysics, Honolulu; and National Oceanic and Atmospheric Administration, Honolulu, Hawaii. Joint Tsunami Research Effort.
E. R. Spielvogel, and L. Q. Spielvogel.
Available from NTIS as PB-224 527 and PB-224 603 for $3.00 in paper copy. Report No HIG-73-2, NOAA-JTRE-67, prepared for the National Science Foundation, Office for the International Decade of Ocean Exploration, June 1973. 11 p, 3 fig, 5 ref. NSF AG-253.

Descriptors: *Waves(Water), *Shallow water, Ocean waves, Tsunamis.
Identifiers: *Solitary waves.

An exact relationship between the speed of a solitary wave and its decay at infinity is derived. It is then compared to the existing shallow water theory as an indication of the merits of the theory in describing the solitary wave at points distant from the crest. (Sinha - OEIS)
W74-06320

RHODE ISLAND COASTAL FIELD DAY: THE BARRIER BEACHES.
Available from NTIS as COM 73-11885 for $2.75 in paper copy. Rhode Island Coastal Field Day: The Barrier Beaches, September 15, 1973. 8 pages.

Descriptors: Barrier islands, Shore protection, Planning, Land use, Rhode Island, Coasts.
Identifiers: Coastal utilization.

This Field Day was designed to provide all interested Rhode Island citizens with information on the origin, natural characteristics, values and management of barrier beaches and associated ponds and marshes. The pamphlet was used as a field guide to various sites where citizens were given brief, explanations on the natural phenomena or processes which would assist them in making decisions in future land use planning. Explanations were given on the geology of the barrier islands, the fish and wildlife, salt marshes and plants that stabilize sand dunes. Finally, a discussion on planning the future of the barrier island complex was held. (Sinha - OEIS)

REGIONAL SEDIMENT YIELD ANALYSIS OF ALASKA STREAMS,
Alaska Univ., College. Inst. of Water Resources.
G. L. Guymon.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY1, Paper 10255, p 41-51, January 1974. 3 fig, 2 tab, 4 ref, append. OWRR A-042-ALAS(2).

Descriptors: *Sediment yield, *Alaska, *Sediment load, Equations, *Regression analysis, Sedimentation, Suspended load, Statistical methods, Sampling, *Glaciohydrology.

Sparse suspended sediment data for Alaska were evaluated to verify regional sediment yield relationships and to test alternative regression correlations using readily obtained watershed parameters. Glacier-fed streams in the south-central region of Alaska were emphasized, although one nonglacial stream in the interior region of Alaska was included for comparison. Plausible, simple relationships can be developed for stream reaches well downstream from the glacier which delivers a high fraction of the total suspended sediment load. A great deal of uncertainty is associated with correlation attempts for short stream reaches near the glacier delivery source. (Knapp-USGS)

RUNOFF AND SEDIMENT YIELDS FROM RUNOFF PLOTS ON CHAINED PINYON-JUNIPER SITES IN UTAH,
Utah State Univ., Logan. Coll. of Natural Resources.
G. F. Gifford.
Journal of Range Management, Vol 26, No 6, p 440-443, November 1973, 2 fig, 3 tab, 7 ref.

Descriptors: *Sediment yield, *Runoff, *Erosion, *Utah, Surface runoff, Soil profiles, Infiltration rates, Infiltrometers, Water yield improvement, Pinyon pine trees, Juniper trees, Mechanical controls.
Identifiers: *Pinyon-juniper, *Chaining, Windrows, Woodlands.

Runoff and sediment yields were studied over a 5 year period (1968-1972) on chained pinyon-juniper sites in Utah. Runoff plots 0.4 hectares in size were used on sites chained-with-debris-windrowed, chained-with-debris-in-place, and natural woodlands from which livestock was excluded. Runoff events occurred during only 2 years (1968-1970) of the study. Runoff amounts from the chained-with-debris-windrowed plots showed water yield increases of 1.2 to 5 times the yield from natural woodlands, with 1.6 to 6 times more sediment than the woodlands. Runoff was equal or less for plots chained-with-debris-in-place as compared to the natural woodlands. Sediment yields were also similar for the two sites. (Mastic-Arizona)

TRANSIENT EXCESS-RADON PROFILES IN PACIFIC BOTTOM WATER,
Scripps Institution of Oceanography, La Jolla, Calif.
Y. C. Chung.
Earth and Planetary Science Letters, Vol 21, No 3, p 295-300, February 1974. 3 fig, 3 tab, 8 ref.

Descriptors: *Water chemistry, *Pacific Ocean, *Radioisotopes, Water circulation, Ocean currents, Diffisivity, Mixing, Diffusion, Dispersion.
Identifiers: *Radon.

Five near-bottom excess-radon profiles were measured at the Geosecs-I station in the northeast Pacific, at varying intervals over a period of 2 1/2 years. These profiles vary considerably in both structure and radon concentration, indicating transient characteristics of the bottom water in the deep Pacific. Only two of the five profiles are of the quasi-exponential type; the stationary vertical eddy diffusivities calculated from these two profiles are 129 sq cm/sec in November 1971, and

22 sq cm/sec obtained 5 months later. A single bottom-radon profile was measured in the western-boundary-current region of the South Pacific at the Geosecs-III station. This profile is also of the quasi-exponential type, with a vertical diffusivity of 32 sq cm/sec. Although the radon concentrations of the three quasi-exponential profiles and the calculated diffusivities are quite different, the integrated excess-radon inventory in the water column, and the calculated flux of radon across the sediment-water interface, vary by only a factor of two in the two areas studied. CHARACTERISATION AND MAGNETIC PROPERTIES OF NATURAL FERRIC GEL,
Centre National de la Recherche Scientifique, Grenoble (France). Transitions de Phases.
J. M. D. Coey, and P. W. Readman.
Earth and Planetary Science Letters, Vol 21, No 1, p 45-51, December 1973. 5 fig, 3 tab, 15 ref.

Descriptors: *Gels, *Iron, *Chemical precipitation, Analytical techniques, Magnetic studies, Infrared radiation.
Identifiers: *Mossbauer effect.

A natural ferric gel precipitated near freshwater springs was characterized by X-ray and electron diffraction, thermal, infrared, magnetic and Mossbauer measurements. It has the composition Fe(OH)3 . 0.9H20. The gel consists of ultrafine amorphous particles of size about 39 angstroms. Its presence is best detected using the Mossbauer effect. The isomer shift (relative to chromium), quadrupole splitting and line width at 296 K are respectively 0.50, 0.72 and 0.48 mm/sec. Above 100 K the susceptibility follows a Curie-Weiss law. Between 10 and 100 K it is superparamagnetic and below 10 K there is a stable magnetic order with the spins in a particle statistically distributed relative to the direction of their resultant moment (8.6 emu/g). GLASS ELECTRODE RESPONSES INTERPRETED BY THE SOLID STATE HOMOGENEOUS- AND HETEROGENEOUS-SITE MEMBRANE POTENTIAL THEORY,
North Carolina Univ., Chapel Hill. William R. Kenan, Jr. Lab. of Chemistry.
R. P. Buck, J. H. Boles, R. D. Porter, and J. A. Margolis.
Analytical Chemistry, Vol 46, No 2, p 255-261, February 1974. 13 fig, 4 tab, 22 ref.

Descriptors: *Ion exchange, *Selectivity, Model studies, Hydrogen ion concentration, Hydrogen, Sodium, Potassium, Cations, Temperature, Theoretical analysis, *Electrodes.
Identifiers: Glass electrodes, Mobility, *Solid state models, *Electrode responses, Ion selective electrodes, Lithium, Membrane electrodes, pH electrodes, Sodium electrodes.

A new theory of glass membrane electrode response based on a solid state model is illustrated by application to lithium and sodium responses of five commercially available low-error pH glass electrodes. Mobility, ion exchange, and overall selectivity parameters have been calculated at several interference activities and temperatures from 6 to 55 C. Beckman sodium selective electrode responses were measured for hydrogen, lithium, and potassium ions and characteristic parameters calculated. For the latter electrodes, conditions giving slow response, non-Nernstian slopes, and long-term drift were explored. The pH glass results suggest that the cation mobilities exceed those of protons while the reverse is found for the sodium-selective glass. The overriding effect of ion exchange selectively follows from the theoretical fit of the experimental data. (Holoman-Battelle)

THE STANDARD POTENTIAL OF THE SINGLE-CRYSTAL COPPER ELECTRODE IN AQUEOUS SOLUTIONS,
Copenhagen Univ. (Denmark). H. C. Oersted Inst.
F. Gronlund, and S. Noer.
Journal of the Electrochemical Society, Vol 121, No 1, p 25-29, January 1974. 3 fig, 2 tab, 13 ref.

Descriptors: *Aqueous solutions, *Zeta potential, *Equilibrium, *Measurement, *Electrochemistry, Electrical properties, *Electrodes.
Identifiers: Copper electrodes, Electromotive force, Silver-silver chloride electrodes.

A cell is described for measuring the equilibrium potential of the Cu/Cu(2 plus), H2O electrode. The cell was vacuum-tight and the water vacuum-distilled in order to eliminate oxygen; the solution was equilibrated with metallic copper before immersion of the electrodes. These were disk-shaped, oriented single crystals made from 99.999 percent copper and vacuum annealed before use. Pairs of differently oriented crystals showed potential differences smaller than 0.02 mV. The standard potential of such electrodes was determined by measuring the emf of cells of the type Ag, AgCl CuC12(M sub o), H2O/Cu with M sub o in the range from 0.00048-0.0025 M. The resulting value, standard potential of the Cu/Cu(2 plus) equals 335.2 plus or minus 0.4 mV at 25 C, is significantly lower than those generally accepted, probably because the accepted values were all obtained from measurements in relatively concentrated cupric sulfate solutions. ARSENIC AND ANTIMONY IN THE TROPICAL ZONE OF THE ATLANTIC OCEAN (MYSH'YAK I SUR'MA V TROPICHESKOY ZONE ATLANTICHESKOGO OKEANA),
Akademiya Nauk URSR, Sevastopol. Marine Hydrophysics Inst.
A. I. Ryabinin, and A. S. Romanov.
Geokhimiya, No 2, p 257-269, February 1973. 5 fig, 1 tab, 23 ref.

Descriptors: *Geochemistry, Water chemistry, *Trace elements, *Atlantic Ocean, *Tropic, Salinity, Water sampling.
Identifiers: USSR, *Arsenic, *Antimony.

As and Sb were determined by neutron-activation analysis in 173 water samples taken from the tropical Atlantic between December 1969 and March 1970. The mean concentrations of these elements were 4.5 and 0.5 micrograms/liter, respectively. Distribution of As and Sb is disproportionate to salinity; ratios of As and Sb concentrations (in g/liter) to salinity (in percent) range from 0.05 to 3.9 times 10 to the minus 7th power and from 0.2 to 3.3 times 10 to the minus 8th power, respectively. Nonuniform geographic and vertical distribution of these elements is determined to a considerable extent by the hydrologic structure of the tropical zone of the Atlantic. The concentration ratio for As and Sb in waters of the tropical Atlantic varies between 1.5 and 51. The mean value for the ratio is 9, which coincides with the ratio of these elements in the lithosphere and in seawater. (Josefson-USGS)

FLUORINE IN SOME NATURAL WATERS OF TADZHIKISTAN (FTOR V NEKOTORYKH PRIRODNYKH VODAKH TADZHIKISTANA),
Akademiya Nauk Tadzhikskoi SSR, Dushanbe. Institut Khimii.
D. L. Patina, and D. N. Pachadzhanov.
Geokhimiya, No 2, p 250-256, February 1973. 1 fig, 1 tab, 29 ref.

Descriptors: *Water chemistry, *Fluorine, *Fluorides, Rivers, *Reservoirs, Groundwater, Floodwater, Low flow, Salts.
Identifiers: *USSR(Tadzhikstan), Mineralization.

Fluoride concentrations in waters of most rivers and reservoirs in northern and western Tadzhikistan during floods range from 0.000013% to 0.000044%. The Kyzyl-Su and Tair-Su Rivers have high salt contents, and their fluoride concentrations (0.000132% to 0.00018%) are similar to those for rivers in Kazakhstan. The fluoride concentration in rivers and reservoirs of northern Tadzhikistan varies with the hydrological stages of the rivers; fluoride concentrations are lower during floods than during low-water periods by a factor of 2 or more. The fluoride concentration during low flow increases when the rivers are supplied by groundwater. A positive correlation is established between fluoride content and total mineralization for most water types examined. Fluoride contents of 13 rivers and 2 reservoirs in southwestern and

northern Tadzhikistan are tabulated. (Josefson-USGS)
W74-06310

CHEMISTRY OF SOME GROUND WATERS IN IGNEOUS ROCKS,
Royal Inst. of Tech., Stockholm (Sweden). Dept. of Land Improvement and Drainage.
G. Jacks.
Nordic Hydrology, Vol 4, No 4, p 207-236, 1973. 16 fig, 3 tab, 45 ref.

Descriptors: *Water chemistry, *Igneous rocks, *Weathering, Hydrogeology, Leaching, Clay minerals, Ion exchange, Sea water, Saline water intrusion, Engineering geology, Groundwater movement.
Identifiers: *Sweden.

The composition of groundwater from igneous rocks is governed by mineral-water equilibria. As these equilibria are established slowly, it is possible to roughly date the waters. It is possible to deduce what kind of clay minerals are encountered by the waters. The fact that montmorillonite is more common in Gothenburg than in Stockholm is nicely illustrated by such analyses. By means of water analyses from wells, it is possible to tell whether or not the clays would cause trouble when tunneling in the rock. Salty groundwaters retained from glacial time were found in Sweden. Sometimes this saltwater can be pumped away. Large local gradients in the groundwater table and permeable tectonic zones favor washing out of the old seawater. These old seawaters have a very specific character. Due to ion exchange they contain much Ca in contrast to fresh seawaters. This provides a means to distinguish them from fresh seawater which has invaded an aquifer due to pumping. (Knapp-USGS)
W74-06371

THE CONTENT OF SOME NATURAL RADIOACTIVE ELEMENTS, ESPECIALLY RN-222, IN SOME POTABLE WATERS IN SWEDEN,
National Inst. of Radiation Protection, Stockholm (Sweden).
J. O. Snihs.
Nordic Hydrology, Vol 4, No 4, p 256-274, 1973. 2 fig, 6 tab, 17 ref.

Descriptors: *Radioisotopes, *Groundwater, Water chemistry, *Water quality, Lead radioisotopes, Radioactivity, *Potable water.
Identifiers: *Sweden, *Radon-22, Polonium.

The content of Rn-222 in drinking water was measured in 118 wells in southeastern Sweden. Only bored wells and especially those in granite bedrock have randon contents which exceed 20 nCi/liter. Dug wells usually have low radon contents (< 2 nCi/liter). Wells on granite bedrock and in till have higher average radon contents than do others. Communal wells (each supplying water to more than 200 people) are most often dug in sand and gravel and can therefore be expected to contain low radon concentrations. The contents of Ra-226, Pb-210 and Po-210 in water from bored wells are low compared to Rn-222. There are no significant correlations between the contents of these nuclides or between their contents and the depths of the wells. The radiation from Rn-222 is completely dominant in comparison with the radiation of the other nuclides examined. Water with a radon content lower than about 100 nCi/liter does not contain Pb-210 and Po-210 of any significance. (Knapp-USGS)

NMR STUDIES OF WATER ADSORBED ON A NUMBER OF SILICA SURFACES,
Nottingham Univ. (England). Dept. of Physics.
R. T. Pearson, and W. Derbyshire.
Journal of Colloid and Interface Science, Vol 46, No 2, p 232-248, February 1974. 8 fig, 1 tab, 60 ref.

Descriptors: *Water structure, Water porperties, Ice, *Freezing, *Heavy water, *Adsorption, *Silica, Physical properties, Pore water, Porosity, Thermal properties, Soil physics, Porous media, Surfaces, *Nuclear magnetic resonance, Analytical techniques.

Broad-line and pulsed nuclear magnetic resonance techniques were applied between -196 and +30 C to examine the freezing of water and heavy water adsorbed at various regain values on four types of amorphous silica of differing surface characteristics. The appearance of two-phase behavior in spin-lattice and spin-spin relaxation processes and the proportion of nonfreezable water were studied as functions of surfaces pore size and BET monolayer coverage. On many samples hysteresis was observed in signal strength, line width, and T(2) relaxation time in the range from -20 to -50 C. Results favor an interpretation in terms of a model involving enhance structuring of unfrozen water inside small filled pores. Evidence is presented of progressive ice formation inside large filled pores and of rapid diffusional exchange in the unfrozen surface layer, both interpore and intrapore. (Brown-IPC)

A PLANNING CONCEPT FOR THE GEORGIA COASTAL ZONE.
Georgia Univ., Athens. Special Task Force Committee.
September, 1972. 31 p, 4 append.

Descriptors: *Coasts, *Water resources development, *Water resources, *Research and development, *Project planning, *Georgia, Water conservation, Land conservation, Project purposes, Inter-agency cooperation, Administration, Coastal plains, Saline water intrusion, Recreation, Environment, Economics, Long-term planning.

An effort was made to formulate and propose an integrated concept for sound planning of the Georgia coastal zone. The special committee felt the coastal zone is in urgent need of unified planning and the report summarizes their conclusions. The introduction gives a background statement of Georgia's coastal zone, and some of the intrusions which infringe upon its resources. A concise definition of the coastal zone and a brief account of the resources are given and supplemented by additional material in the Appendix. In analyzing the status of the zone, key features of the economy were reviewed, and those aspects of the natural environment that merit consideration in the planning effort were identified. The planning concept itself was discussed, and the development of the plan is based upon three major considerations--the natural environment, citizen involvement, and legal precedents. The planning process called for two major action phases: the make-up of a planning team and a sequence of task assignments. The appendices further analyze the coastal zone, its status, the classification of coastal zone resources and the planning process. (Sutton-Florida)

LOUISIANA WETLANDS PROSPECTUS.
Louisiana Advisory Commission on Coastal and Marine Resources, Baton Rouge.
Final Report, September, 1973. 346 p, 32 fig, 13 map, 13 tab, 15 photo, 274 ref, 3 append.

Descriptors: *Water resources development, *Coasts, *Coastal marshes, *Water resources, *Land resources, Louisiana, Land use, Recreation, Water demand, Water quality control, Inter-agency cooperation, Ecology, Legal aspects, Publications, Water law, State governments, Planning, Project purpose, Estuary, Estuarine environment.

A workable coastal zone management program for Louisiana is discussed. Eleven subjects of coastal and marine resources management were considered. These included population growth and urbanization, land use, recreation, waste management, water quality, water and power development, transportation and trade, engineering and technology, marine science, research and education. Weather, climate and oceanographic conditions were monitored, socioeconomic and legal matters were also considered, as were federal plans for coastal zone management. These subjects were studied with a view toward meeting five objectives. Chapter One gives a summary of the Commission's work. Chapters Two through Four present an inventory on the state's coastal resources, trends in the use of them and a series of specific recommendations for planning and managing growth and conservation in a wetlands environment. Chapter Five gives the recommended legal and administrative framework and includes a draft statute. Chapter Six deals with critical questions surrounding ocean engineering

and development, research and education, recreation, culture and tourism and new technical developments. The Commission relied on research and studies already available in analyzing many issues and an appendix outlines some of these. (Sutton-Florida)

GUIDE TO IDENTITY OF EGGS AND LARVAE OF SOME GULF OF MEXICO CLUPEID FISHES,
Rosenstiel School of Marine and Atmospheric Sciences, Miami, Fla.
E. D. Houde, and P. L. Fore.
Available from the National Technical Information Service as COM-73-11418 $3.00 in paper copy; $1.45 in microfiche. Report No NOAA-73 81602, April 1973. 14 p, 4 fig, 2 tab, 32 ref. Contract No NOAA-2-35147.

Descriptors: *Marine fish, *Fish eggs, *Fish taxonomy, *Larvae, *Gulf of Mexico, *Herrings, Animal groupings, Fish reproduction, Spawning, Life history studies.
Identifiers: Gulf menhaden, Thread herring, Spanish sardine, Round herring, Scaled sardine, Dwarf herring, Yellowfin menhaden, Finescale menhaden, Orangespot sardine.

Descriptions of eggs and larvae of Harengula pensacolae, Brevoortia spp., Etrumeues teres, Opisthonema oglinum, and Sardinella spp. are given based on examination of specimens from the Gulf of Mexico, from laboratory rearing experiments, and from reports in the literature. A key to larvae is presented, primarily for identifying specimens longer than 15 mm standard length, but usually providing identification for much smaller specimens. A brief review of pertinent literature is included. (Holoman-Battelle)

PRELIMINARY INVESTIGATIONS OF AN INTERTIDAL SAND BODY, COBEQUID BAY, BAY OF FUNDY,
McMaster Univ., Hamilton (Ontario). Dept. of Geology.
R. W. Dalrymple.
Maritime Sediments, Vol 9, No 1, p 21-28, April 1973. 6 fig, 5 ref.

Descriptors: *Sedimentary structures, *Sand bars, *Ripple marks, *Tides, *Canada, Currents(Water), Bores, Sediment transport, Intertidal areas, Bays.
Identifiers: *Bay of Fundy, Cobequid Bay.

The highest recorded tidal range in the world, 55 ft., was measured off Burntcoat Head in Cobequid Bay, Nova Scotia, Canada. At low tide, an extensive complex of sand bars is exposed. At high tide, these sand bodies are covered by several tens of feet of water. Thus, the results of processes operating at depths otherwise virtually inaccessible are easily available for study, modified by those features attributable to emergence. Selmah bar appears to be in dynamic equilibrium. Megaripple slip face orientations yield a strongly bimodal distribution. Thus, depending on the preservation of cross-stratification, cross-bedding might be expected to exhibit the same bimodal distribution with the maxima 180 deg apart. Tidal current time-velocity asymmetry is a pervasive factor in the study of intertidal or tidal environments and determines the dominant direction of sediment transport. The pattern of sediment transport due to tidal currents is disrupted to a considerable extent by open-channel flow immediately before and during exposure, resulting in a complex transport system. The plan form of megaripples results from a complex interplay of current velocity, bedload, water depth, length of time for development and the uniformity of current direction. Megaripple amplitude and wavelength are strongly influenced by current velocity and water depth, and possibly by grain size. (Knapp-USGS)

SEDIMENTARY REFLECTION OF DEPOSITIONAL ENVIRONMENT IN THE BARDAWIL LAGOON, NORTHERN SINAI,
Geological Survey of Israel, Jerusalem. Marine Geology Div.
Y. Levy.
Journal of Sedimentary Petrology, Vol 44, No 1, p 219-227, March 1974. 6 fig, 1 tab, 19 ref.

Descriptors: *Sedimentation, *Provenance, *Water chemistry, *Lagoons, Deposition(Sediments), Carbonates, Gypsum, Evaporation, Sands, Clays, Salinity, Brines, Littoral drift, Barrier islands.
Identifiers: *Mediterranean, *Sinai region.

Bardawil lagoon in the northern Sinai is separated from the Mediterranean by a sand barrier. The decrease in specific alkalinity of the waters with increasing distance from the inlets and with increasing chlorosity suggest that authigenetic carbonates are precipitating at present from the lagoon waters. The predominant type of sediment is sand, covering all the nearshore and nearbar areas; clayey sand covers the deepest and the most distant parts from the inlets, which connect the lagoon with the Mediterranean. The western-arm sediments, composed of sand containing marine diatoms and pelecypods, show that the region was under marine conditions throughout the period represented by the column of sediments studied. In the main lagoon a change from marine conditions, represented by sand and marine shells found in the deeper portions of the cores to lagoonal evaporitic ones in the upper sediments (gypsum and clayey sediments present) is clearly demonstrated. At present the salinity of the lagoon waters does not permit the precipitation of gypsum. The relative abundance of the sand, the spatial distribution of gypsum and marine and lagoonal diatoms suggest that the sedimentary column studied was formed under marine to lagoonal conditions and that no streams entered the lagoon during this period. The sediments were brought to the lagoon from the Mediterranean. The Nile branches (including the Pelusiac) brought the sediments to the Gulf of El Tina in the Mediterranean, and longshore west-east currents brought the sediments to the lagoon. (Knapp-USGS)

THE COMPUTATION OF TIDES AND CURRENTS IN ESTUARIES AND CANALS: APPENDIX A: A USER'S MANUAL,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
D. R. F. Harleman, and M. L. Thatcher.
Available from NTIS as AD-762 613 for $3.00 in paper copy. Technical Bulletin No 16, Appendix A, Prepared for Committe of Tidal Hydraulics, June 1973. 122 p, 10 fig, 7 tab, 8 ref, 2 addendum. DA-22-079-CIVENG-65-20.

Descriptors: Mathematical models, *Estuaries, *Computer programs, *Canals, Tides, Currents(Water), Sea level, *Data processing.
Identifiers: *Boundary conditions, *Embayments, Panama Canal, Delaware River Estuary.

This User's Manual is issued as an appendix to Technical Bulletin No. 16 (W73-12428) entitled 'The Computation of Tides and Currents in Estuaries and Canals.' The mathematical model consists of the one-dimensional continuity and momentum equations applicable to variable area estuaries, embayments, or sea-level canals. The equations are solved simultaneously by means of an explicit finite-difference scheme to yield values of tidal elevation and discharge along the longitudinal axis of the waterway. The three original programs have been modified and combined into a single computer program in which the user specifies the boundary conditions appropriate to the type of estuary, embayment, or canal under consideration. The procedures for geometric schematization of a tidal waterway are outlined and guidelines for the choice of Delta x and Delta t are given. The general structure of the computer program is described and detailed instructions are given for input data and format. Two test cases are presented to document the use of the computer program and to furnish the user with a basis of comparison. The first test case is a closed-end estuary (the Delaware) and the second is a proposed route for a sea-level canal (Panama). Complete listing of the input and output for the test cases are given. A plotting program for the graphical display of time varying tidal elevations and discharges at selected longitudinal stations is given. The computer program contains built-in checks on certain logic conditions; these are discussed as well as possible error messages which may result from inadvertent omissions. The final section contains hints for modifying the program and a discussion of its implementation on different computer systems. (Sinha - OEIS)

A PACKAGE PROGRAM FOR TIME-STEPPING LONG WAVES INTO COASTAL REGIONS WITH APPLICATION TO HALEIWA HARBOR, OAHU,
Hawaii Inst. of Geophysics, Honolulu; and National Oceanic and Atmospheric Administration, Honolulu, Hawaii. Joint Tsunami Research Effort.
H. G. Loomis.
Available from NTIS as COM 73-10596 for $3.00 in paper copy. Report No HIG 72-21 and NOAA JTRE-79, October 1972. 33 p, 15 fig, 4 ref, 2 append. NOAA.

Descriptors: Hawaii, *Computer programs, Harbors, *Shallow water, *Coasts, Bays, Bathymetry, *Waves(Water).
Identifiers: *Long waves, Hydrodynamic equations.

A method is described for time-stepping a long wave of any predetermined description and direction of arrival into a harbor, bay, or other coastal region. Long-wave, shallow-water equations are used. Information is given on the considerations involved in the construction of a computer code and of the code itself, and instructions are given on how to use the code. An example of time-stepping a wave into Haleiwa Harbor and listing of computer programs are appended. (Sinha - OEIS)
W74-06316

SHALLOW WATER EXPERIMENT UTILIZING THE STD MODEL 9006 AT A FIXED POINT,
Naval Postgraduate School, Monterey, Calif.
W. J. Frigge.
Available from NTIS as AD-769 408 for $6.25 in paper copy. Master's thesis, March 1973. 79 p, 5 fig, 7 tab, 11 ref, 4 append.

Descriptors: California, *Salinity, Shallow water, *Instrumentation, *Computer programs, Measurement.
Identifiers: *STD Model 9006.

The salinity sensing capabilities of the STD Model 9006 were examined in laboratory and in shallow water field conditions both in Monterey Bay and at the N.U.C. Tower off Mission Beach at San Diego, California. Laboratory studies showed it to be influenced by changes in water velocity from zero to non-zero. Field studies showed that the instrument was unsuitable for sensing instantaneous microstructure fluctuations of salinity in shallow water while being held at a single depth in a wave influenced regime. Averaged over a period of ten seconds or more, however, the output of the instrument was judged to be accurate to at least the first decimal place. (Sinha - OEIS)
W74-06317

A NEW METHOD FOR DETERMINING NORMAL MODES OF IRREGULAR BODIES OF WATER WITH VARIABLE DEPTH,
Hawaii Inst. of Geophysics, Honolulu; and National Oceanic and Atmospheric Administration, Honolulu, Hawaii. Joint Tsunami Research Effort.
H. G. Loomis.
Available from NTIS as PB-224 613, PB-224 516 for $4.00 in paper copy. Prepared for National Science Foundation, International Decade of Ocean Exploration, HIG-73-10, NOAA-JTRE-86,/June 1973. 27 p, 8 fig, 4 tab, 3 ref. NSF AG-253.

Descriptors: *Shallow water, *Waves(Water), Equations, *Computer programs, Bays, Oceans, Tsunamis.
Identifiers: Difference equations.

This report supersedes one by Loomis (A Method of Setting Up the Eigenvalue Program for the Linear, Shallow-Water-Wave Equation for Irregular Bodies of Water with Variable Water Depth and Application to Bays and Harbors in Hawaii, Hawaii Inst. of Geophysics Rept. HIG-70-32, Univ. of Hawaii, Honolulu, 1970) on finding normal modes of irregular bodies of water with variable depth. The present method ensures that the matrix corresponding to the differential operator is symmetric, guaranteeing that eigenvalues are real and allowing use of the many available computing techniques suitable for symmetric matrices. Also, only half the matrix need be stored, thereby saving on storage space. The boundary conditions Phi = O or Phi sub n = O are satisfied in a natural way without the assignment of grid points outside the boundaries of the water, as was necessary previously. The numerical code comes in a neat package, to which the user need add only the bathymetry of the water (with water depths of zero assigned at land areas) and certain parameters of the grid, and specify the type of output desired. An additional output possible from the code is a contour map of the normal modes. (Sinha - OEIS)

THEORY, DEVELOPMENT, AND UTILIZATION POTENTIAL OF THE BIOMILIEU CONCEPT,
Army Engineer District, Chicago, Ill.
I. J. Szekelyhidi.
Water Resources Bulletin, Vol 8, No 1, p 24-37, February, 1972. 11 fig, 6 ref.

Descriptors: *Bioindicators, *Biorhythms, *Ecology, Soil, Management, Environment, Biological communities, Computers, Computer models, Cost-benefit analysis, *Estuarine environment.
Identifiers: *Biomilieu Theory, *Biomilieu index, Environmental quality index, Biocatalytic.

A quantitive engineering approach to analysis of total environment allowing for simultaneous consideration of a theoretically infinite number of quality indicators and physiological requirements is presented. Theory and fundamentals of a two-dimensional space and time function solution concerning a small estuarine-type environment are discussed. A three-dimensional solution is indicated. Input data may range from reconnaissance-type to the outputs of mathematical transport models. Applications are discussed with respect to environmental quality problems, availability of suitable data, and some areas of research where results could find immediate application. SPAWNING, LARVAL SETTLEMENT, GROWTH, BIOMASS, AND DISTRIBUTION OF CIONA INTESTINALIS L. (TUNICATA) IN BORGENFJORDEN, NORTH-TRONDELAG, NORWAY,
B. Gulliksen.
Sarsia. 51, p 83-96. 1972. Illus.
Identifiers: Biomass, *Ciona-intestinalis, Distribution, Growth, Larval settlement, *Norway(Borgenfjorden), Spawning, *Tunicata(Larvae).

Spawning, larval settlement, growth, variation of biomass, and distribution of C. intestinalis in Borgenfjorden were investigated using submerged slabs of eternite and line transects. In 1970, the spawning started at a temperature between 8C-12C in May-June and continued to Aug.-Oct. with main settlement on the bottom in June. Settling was also observed during the winter, but these larvae were probably recruited from populations outside Borgenfjorden. The highest values of biomass on the line transects were observed from Aug.-Nov. on hard-bottom localities in outer Borgenfjorden. The biomass per m2 was larger on the enternite slabs than in the line transects, mainly due to heavy predation both on larvae and adult C. intestinalis on the line transects.--Copyright 1973, Biological Abstracts, Inc.

A REVIEW OF THE OCEANOGRAPHY AND RENEWABLE RESOURCES OF THE NORTHERN GULF OF ALASKA.
Alaska Univ., College. Inst. of Marine Science.
IMS Report R72-23 (Sea Grant Report 73-3), February 1972. 690 p. NOAA Grant 04-3-158-41.

Descriptors: *Oceanography, *Reviews, *Pacific Ocean, *Alaska, *Continental shelf, Water circulation, Ocean currents, Fisheries, Water chemistry, Sedimentation, Hydrology, Glaciology, Water pollution, Oil pollution.
Identifiers: *Gulf of Alaska.

The first oceanographic observation in the northern Gulf of Alaska were made by Captain Cook in 1778. Although many cruises of exploration and commercial exploitation took place in the years that followed, it was not until the late 1920's that full-scale oceanographic observations. Routine sampling of the Gulf of Alaska did not start again until after the end of the Second World War. Even with the increased emphasis on oceanography in the late 1950's, observation in the northern Gulf of Alaska can at best be described as spotted. This lack of information can be ascribed to unfavorable weather conditions and distance from the major oceanographic centers. The coastal area of the northeastern Gulf of Alaska is characterized topographically by a relatively straight coastline and by extensive coastal lowlands. This is in contrast to elsewhere in the Gulf of Alaska where the coastline is extremely irregular and the mountains rise abruptly from the shore. The coastal lowlands extend inland 2 to 40 miles to the southern front of the Chugach and St. Elias Mountains. Despite the relatively mild climate at sea level in this region, about one-fifth of the coastal land is covered by glaciers or by permanent ice and snow fields. The continental shelf varies in width from a maximum of 60 miles off Prince William Sound to a minimum of 7 miles off Cape Suckling just east of Kayak Island. In general, the shelf is marked by irregular topography resulting from its past glacial history. This is a broad review of the present state of knowledge of the oceanography and renewable marine resources of the Gulf of Alaska. It is the most complete collection of Gulf of Alaska environmental and renewable source data which has been assembled to data. (See W74-06427 thru W74-06434) (Knapp-USGS)
W74-06426

PHYSICAL OCEANOGRAPHY OF THE NORTHERN GULF OF ALASKA,
Alaska Univ., College. Inst. of Marine Science.
T. C. Royer.
In: A Review of the Oceanography and Renewable Resources of the Northern Gulf of Alaska: Alaska University Institute of Marine Science Report R72-23 (Sea Grant Report 73-3), Section 1. p 5-22, February 1972. 7 fig, 1 tab, 33 ref. NOAA Grant 04-3-158-41.

Descriptors: *Oceanography, *Alaska, *Continental shelf, *Reviews, Currents(Water), Mixing, Water circulation, Ocean currents, Water temperature.
Identifiers: *Gulf of Alaska.

Research in the field of physical oceanography in the Gulf of Alaska is reviewed. It covers a time span of about 45 years. However, the duration is deceptive since the number of oceanographic expeditions tend to be grouped in the summer months to take advantage of favorable climatic conditions. Most investigations were undertaken with the purpose of providing data to assist in the evaluation of the fisheries of the region. Recent studies are generally more concerned with providing data basic for the understanding of the entire air-sea system. Description of the physical oceanographic parameters in the North Pacific yields little insight into the short-term variation of conditions on the shelf region in the Gulf of Alaska. The air-sea interaction on the shelf apparently modifies the oceanographic parameters to a large extent making it necessary to have data on the local effects before a complete understanding of the local dynamics can be accomplished. Winter convective mixing extends to the ocean bottom on the continental shelf. The minimum water temperature in the region is about 1C colder than the previously reported low of 2.78C. It appears that the bottom of the halocline extends partially onto the shelf region, which indicates that the outer part of the shelf does not have season water-mass fluctuations as a result of convective cooling. (See also W74-06426) (Knapp-USGS)
W74-06427

CHEMICAL OCEANOGRAPHY OF THE GULF OF ALASKA,
Alaska Univ., College. Inst. of Marine Science.
L. Longerich, and D. W. Hood.
In: A Review of the Oceanography and Renewable Resources of the Northern Gulf of Alaska: Alaska University Institute of Marine Science Report R72-23 (Sea Grant Report 73-3), Section 2, p 23-55, February 1972. 18 fig, 3 tab, 37 ref. NOAA Grant 04-3-158-41.

Descriptors: *Water chemistry, *Alaska, *Continental shelf, *Reviews, *Oceanography, Trace elements, Nutrients.
Identifiers: *Gulf of Alaska.

The chemical data available for the Gulf of Alaska, particularly the near-coastal area, are limited and very sporadic. These consist largely of short-term observations of the concentration of some of the chemical parameters in the area with no information on the seasonal effects or on the dynamic processes w which control these concentrations. In the northern Gulf of Alaska in the area inside the 200-meter depth profile and between Cross Sound and Kodiak Island, only limited chemical information is available. Inorganic nutrients have been the only chemical parameters measured in this region except for a brief study near Kodiak Island in June 1967. Although there has been a considerable number of measurements of hydrography and nutrients in the Gulf of Alaska and the North Pacific Ocean area, few actual stations were occupied on the continental shelf. (See also W74-06426) (Knapp-USGS)
W74-06428

A REVIEW OF THE BIOLOGICAL OCEANOGRAPHY OF THE NORTHEAST PACIFIC OCEAN,
Alaska Univ., College. Inst. of Marine Science.
R. T. Cooney.
In: A Review of the Oceanography and Renewable Resources of the Northern Gulf of Alaska: Alaska University Institute of Marine Science Report R72-23 (Sea Grant Report 73-3), Section 3, p 57-74, February 1972. 3 fig, 2 tab, 53 ref. NOAA Grant 04-3-158-41.

Descriptors: *Oceanography, *Pacific Ocean, *Arctic, *Productivity, Primary productivity, Systematics, Plankton, Benthos, Continental shelf, Currents(Water), *Reviews, Ocean currents.
Identifiers: Biological oceanography, Gulf of Alaska.

Since geostrophic circulation near the northern shelf of the northeast Pacific would seem to preclude any large-scale upwelling from depth, the general level of coastal photosynthesis should not exceed that of the open ocean by more than a factor of three. In the absence of large numbers of interzonal grazers, a typical spring 'bloom' is likely, with production beginning over the shelf as early as March. The species composition and successional phenomena in the seasonally developing plankton community should reflect more the neritic character of the coastal zone than that of the open ocean, particularly during the time of maximum runoff; pelagic larvae and juveniles of benthic populations, the temporary zooplankton, would be expected in much greater abundance here than in the central Gulf of Alaska. (See also W74-06426) (Knapp-USGS)

THE INTERTIDAL REGION OF THE GULF OF ALASKA,
Alaska Univ., College. Inst. of Marine Science.
H. M. Feder, and G. Mueller.
In: A Review of the Oceanography and Renewable Resources of the Northern Gulf of Alaska: Alaska University Institute of Marine Science Report R72-23 (Sea Grant Report 73-3), Section 4, p 75-130, February 1972. 8 fig, 1 tab, 179 ref. NOAA Grant 04-3-158-41.

Descriptors: *Oceanography, *Pacific Ocean, *Arctic, *Productivity, Primary productivity, Systematics, Plankton, Benthos, Continental shelf, Currents(Water), *Reviews, Ocean currents.
Identifiers: Biological oceanography, *Gulf of Alaska.

Review of the biological literature indicates that basic information on trophic relationships for coastal littoral communities of the Gulf of Alaska is limited. The rugged coastline of the Gulf of Alaska is not well known, and very few of its shores have been described sufficiently to be of any correlative value to ecological studies on them. However, some rocky and sandy shores from Amchitka Island to Yakutat Bay have been described in varying detail. The region of Controller Bay from the edge of the Copper River Delta to the Bering Glacier (about 28 miles) is known to be a region of oil seepage, and oil on beaches near these seeps has been described. The taxonomy of the following groups in the Gulf of Alaska is relatively well understood: Annelida (Polychaeta), Arthropoda (Crustacea), Mollusca, Echinodermata (Asteroidea and Ophiuroidea), Chordata (Fishes). The Gulf of Alaska can be divided into two distinct floristic regions: (1) a northern coastal region from northern Washington to Yakutat and (2) a western region from Kodiak Island to Attu Island. The two regions overlap and show a transition between the two floras. The flora of the northern region is well known but not complete. The western region is much less known with little published work on flora here. The transition region is little known, and no survey work has been published. Ecologically oriented research includes a survey of Three Saints Bay, Kodiak Island, a study in Prince William Sound which was initiated immediately after the 1964 Alaska earthquake to assess changes in the intertidal region; and a study in the vicinity of the test site on Amchitka Island. The ecological information from the three study sites was not directly comparable since the regions were quite different in physical environmental features. (See also W74-06426) (Knapp-USGS)

COASTAL WEATHER, TIDES AND WIND WAVES OF THE NORTHERN GULF OF ALASKA,
Alaska Univ., College. Inst. of Marine Science.
D. H. Rosenberg.
In: A Review of the Oceanography and Renewable Resources of the Northern Gulf of Alaska: Alaska University Institute of Marine Science Report R72-23 (Sea Grant Report 73-3), Section 5, p 131-141, February 1972. 6 fig, 1 tab, 4 ref. NOAA Grant 04-3-158-41.

Descriptors: *Pacific Ocean, *Arctic, *Weather data, *Tides, *Waves(Water), Reviews, Climatic data, Wind tides.
Identifiers: *Gulf of Alaska, Wind waves.

The coastal weather, tides and wind waves of the northern Gulf of Alaska are reviewed. The climate along the rim of the Gulf of Alaska is definitely

marine. In the winter, the water is much warmer than the air, while in the summer the air is warmer than the water. This results in mild winters and cool summers. Winter winds are predominantly easterly in the northern Gulf. Summer winds are influenced by the North Pacific High which causes winds along the Alaskan coast to be generally light and variable. The tides along the northeastern Gulf of Alaska are semidiurnal in nature with a marked inequality between successive low waters. The mean diurnal range varies from 10.1 feet at Yakutat to 10.6 feet at Seward. Middleton Island has a diurnal range of 10.3 feet. In general, the wind waves in the northeastern Gulf of Alaska are less than 12 feet high. Very severe storms that have generated waves as high as 40 feet occur in the Gulf of Alaska. THE LAND HYDROLOGY OF THE SOUTH-CENTRAL COASTAL ZONE,
Alaska Univ., College. Inst. of Water Resources.
R. F. Carlson.
In: A Review of the Oceanography and Renewable Resources of the Northern Gulf of Alaska: Alaska University Institute of Marine Science Report R72-23 (Sea Grant Report 73-3), Section 7, p 149-152, February 1972. 3 ref. NOAA Grant 04-3-158-41.

Descriptors: *Hydrology, *Runoff, *Sediment yield, *Alaska, *Reviews, Streamflow, Hydrologic data, Glaciers.
Identifiers: *Gulf of Alaska.

The most significant aspect of the hydrologic system of Alaska's south-central region, an area of some 100,000 sq mi, is the tremendous variety which occurs within this zone. There are few places in the United States which represent a greater variety of temperature, streamflow, and precipitation extremes within an area of this size. The region is characterized by a brief summer runoff season, a great number and volume of glaciers, a large volume of silt discharge in the streams during the summertime, and large elevation differences. Only limited hydrological studies have been made in this area. There exist only some eighty climatological stations in this region (IATCA, 1970). These stations are confined primarily to lower elevations along the sea coast and the river valleys. (See also W74-06426) (Knapp-USGS)
W74-06433

GEOLOGY AND GEOMORPHOLOGY OF THE CENTRAL GULF OF ALASKA CONTINENTAL SHELF,
Alaska Univ., College. Inst. of Marine Science.
F. F. Wright.
In: A Review of the Oceanography and Renewable Resources of the Northern Gulf of Alaska: Alaska University Institute of Marine Science Report R72-23 (Sea Grant Report 73-3), Section 8, p 153-160, February 1972. 1 fig, 35 ref. NOAA Grant 04-3-158-41.

Descriptors: *Geology, *Geomorphology, *Sedimentation, *Glaciation, *Alaska, Reviews.
Identifiers: *Gulf of Alaska.

The continental margin of the Gulf of Alaska reflects the complex recent orogenic and climatic history of the northernmost Pacific area. The region of particular interest lies between Kodiak Island and Yakutat Bay, an area which actually represents the seaward expression of a bight, where the entire North American cordillera has been deflected at least 90 deg close to the eastern end of the Aleutian arc and trench system. Tectonic mechanisms in the general area remain to be defined, but proponents of crustal-plate tectonic hypotheses have suggested that the current cycle of orogenic activity may be related to the opening of the Gulf of California and the resulting strong relative movement between the Pacific and American plates. There has been significant glaciation in the hinterland of the Gulf of Alaska for at least the past three million years. The combination of tectonism and intense glaciation has resulted in a very complex recent geologic history for the central Gulf of Alaska continental shelf region. (Knapp-USGS)

TROPIC ANALYSES OF AN ESTUARINE MANGROVE COMMUNITY,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
W. E. Odum, and E. J. Heald.
Bull Mar Sci. Vol 22, No 3, p 671-738, 1972. Illus.
Identifiers: Birds, Energy balance, *Estuarine environment, Fish food, *Florida(North River basin), Invertebrates, *Mangroves, *Trophic analysis.

Fringing the southwest coast of Florida is a mangrove belt which supports large populations of birds, gamefishes, and invertebrate species of commercial importance. A study was conducted between 1967 and 1969 in the North River basin of this mangrove region to determine the energy basis for this large population of animals and to delineate the routes by which energy is transferred through the food web. This is the first of 3 publications summarizing the results of this study. Summaries of food habits for most of the fish and aquatic invertebrate species which occur in the North River mangrove ecosystem are given. In addition to 10,000 analyses of stomach contents, information from other publications has been summarized where pertinent. Finally, for most species there is an estimate of relative importance in the North River system in terms of abundance.--Copyright 1973, Biological Abstracts, Inc.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

DESALTED SEAWATER FOR AGRICULTURE: IT IS ECONOMICAL,
Resources for the Future, Washington, D.C.
M. Clawson, H. H. Landsberg, and L. T. Alexander.
In: Coastal Deserts, their human and natural environments, ed. by D.H.K. Amiran and A. W. Wilson, University of Arizona Press, Tucson, 1973. p 45-54, 19 ref.

Descriptors: *Desalination, *Sea water, *Comparative costs, *Irrigation water, *Nuclear powerplants, Desalination processes, Byproducts, Desalination wastes, Nuclear reactors, Treatment facilities, Desalting plants, Water sources, Brackish water, Water delivery, Water distribution(Applied).
Identifiers: *Middle East, Nuclear desalination.

Desalination has been actively suggested as a solution for the water shortage problem in agriculture for coastal deserts in recent years. The principal area of concern has been the Middle East. Although any desalination system requires an energy source, a process and a transportation system, and many of such systems are available, nuclear dual-purpose generator-desalination facilities are discussed in particular. Performance of such a plant, capital availability and costs, and operational costs are discussed in the economics of the process. Thermal and salinity environmental effects are considered, as are the nuclear accident possibilities, additional environmental considerations for a plant of this type. Transportation of the desalted water to the irrigation site is one of the most important and least considered elements in the utilization of nuclear desalting for agriculture. Pumping costs, capital outlay for pipeline, conveyance losses, and distribution systems are all elements of this consideration. The value of the irrigation water made available by desalination is dependent on the effectiveness of the agricultural plan in which the water is put to use. This is now, and appears to be for some time, far below the cost of obtaining the water by nuclear desalination. (Muller-Arizona)

PLASTIC OASES FOR ARID SEASHORES,
Arizona Univ., Tucson. Environmental Research Lab.
C. N. Hodges, M. H. Jensen, and C. O. Hodge.
In: Coastal Deserts, their natural and human environments, ed. by D.H.K. Amiran and A.W. Wilson, Univ. of Arizona Press, Tucson, 1973. p 55-61, 3 fig, 5 tab, 10 ref.

Descriptors: *Greenhouses, *Desalination, *Vegetable crops, *Coasts, *Agricultural engineering, Plastics, Arid lands, Irrigation, Water sources, Structures, Environment, Growth chambers, Arid climates, Sands, Deserts.
Identifiers: *Sonoran desert, Gulf of California.

Desalination of sea water along coastal deserts may be one solution to the need for increased supplies of fresh water for certain agricultural crops. Experimentation for over a decade on the arid Sonoran coast of the Gulf of California has succeeded in providing a prototype of power/water/food facility that uses the waste heat from the desalination process to heat the plastic greenhouses that are producing phenomenal vegetable crops for several commercial undertakings. The utilization of local sand as growing medium, humidification, fertilization and nutrient distribution, and plant breeding have all been elements in the studies. Squash, peppers, okra, beans, eggplant, lettuce, radishes, tomatoes, and cucumbers have been successfully cultivated in these inflated greenhouses with yields much greater and with longer growing seasons that comparable field crops. The Abu Dhabi facility on the Persian Gulf has proved to be a dependable supplier of fresh vegetables to a large population. These manmade oases also have future applications in the cultivation of grain crops such as rice or wheat in arid regions. (Muller-Arizona)

3B. Water Yield Improvement

SIXTH ANNUAL SURVEY REPORT ON THE AIR WEATHER SERVICE WEATHER MODIFICATION PROGRAM (FY 1973),
H. A. Chary, T. S. Cress, R. L. Lininger, and K. M. Weickmann.
Available from NTIS, Springfield, Va. 22151 as AWS-TR-73-251. Price $3.00 printed copy; $1.45 microfiche. Air Force Air Weather Service (MAC) Technical Report 73-251, October 1973. 22 p, 4 fig, 6 tab, 10 ref.

Descriptors: *Weather modification, *Fog, Ice fog, Cloud seeding, Research and development.
Identifiers: *Fog dissipation(Artificial), *Fog dispersal.

During FY 73 USAF Air Weather Service carried out six field projects--four to dissipate supercooled fog, and one each to dissipate warm and ice fog. In addition, cold fog was routinely and operationally dissipated at Fairchild AFB, Washington. The propane system installed at Elmendorf AFB,

Alaska, last year underwent its first season of testing. Airborne seeding with dry ice was available for European use. Such seeding was used for a period at Elmendorf AFB, but was not needed in Europe. A test was made of helicopter downwash and hygroscopic seeding for clearing warm fog. Dissipation of ice fog at Eielson AFB was attempted. A brief description of the procedures, equipment, and results of the tests is given. (Knapp-USGS)
W74-06356

IMPACTS OF INDUCED RAINFALL ON THE GREAT PLAINS OF MONTANA.
Montana State Univ., Bozeman.
Montana Agricultural Experiment Station Bulletin 670 (Final contract report), August 1973. 58 p, 6 fig, 2 tab. USBR Contract 14-06-D-7171.

Descriptors: *Cloud seeding, *Weather modification, *Montana, Ecology, Social impact, Agriculture, Crop production, Economic impact, Political aspects, Grasslands, Grazing, Wildlife.

Potential impacts of a successful program of weather modification in Montana wherein rainfall is increased were evaluated. Areas investigated include agriculture, ecology, sociology, economics and hydrology. Historical data include range and crop yield, weather, animal growth, soil and range surveys, research results and related research projects. Generally the impacts on agriculture have been positive varying with the timeliness of increased precipitation. Economic impacts have also been favorable indicating increased revenue from increased crop and range yields. Opinion questionnaires indicate a considerable gap in understanding by potential users, as well as wide range of reactions to cloud seeding. Possible problems which may result from weather modification are pointed out. (See W74-06443 thru W74-06447). (Knapp-USGS)
W74-06442

ECOLOGICAL IMPACTS: PART 1--RANGE AND RANGE LIVESTOCK PRODUCTION,
Montana State Univ., Bozeman. Dept. of Animal and Range Sciences.
W. G. Ballard, and D. E. Ryerson.
In: Impacts of Induced Rainfall on the Great Plains of Montana: Montana Agricultural Experiment Station Bulletin 670 (Final contract report), P 9-12, August 1973. USBR Contract 14-06-D-7171.

Descriptors: *Cloud seeding, *Weather modification, *Montana, *Forage grasses, Ecology, Social impact, Agriculture, Crop production, Economic impact, Political aspects, Grasslands, Grazing, Wildlife.

Increased precipitation resulting from weather modification will probably have a significant effect on range forage production only when combined with good livestock and grazing management practices. There may be a change in species dominants in plant communities found in vegetational types, but a drastic shift in vegetational types in the plains area of Montana is not expected. An increase in precipitation due to weather modification will result in increased weed growth and infestations. On ranges in good condition or better and under moderate grazing use, an increase in precipitation apparently does not affect cattle weight gains. (See also W74-06442) (Knapp-USGS)
W74-06443

ECOLOGICAL IMPACTS: PART II--WILDLIFE AND BIOCOMMUNITIES,
Montana State Univ., Bozeman. Dept. of Animal and Range Sciences.
J. J. Grensten, and D. E. Ryerson.
In: Impacts of Induced Rainfall on the Great Plains of Montana: Montana Agricultural Experiment Station Bulletin 670 (Final Contract report), p 13-15, August 1973. USBR Contract 14-06-D-7171.

Descriptors: *Cloud seeding, *Weather modification, *Montana, Ecology, Social impact, Agriculture, Crop production, Economic impact, Political aspects, Grasslands, Grazing, *Wildlife, *Biological communities.

In Montana, artificially increased rainfall will probably not affect big game species to any great extent. Major changes in vegetation may change distribution of big game animals. Added precipitation is not the major factor that will affect wildlife species. It is the changes in land use and different managerial practices that are brought about by weather modification. These changes can be beneficial or detrimental to the future of many wildlife species depending upon how the land is used and managed. (See also W74-06442) (Knapp-USGS)
W74-06444

AGRICULTURAL IMPACTS,
Montana State Univ., Bozeman. Dept. of Plant and Soil Science.
J. M. Caprio, and J. S. Williams.
In: Impacts of Induced Rainfall on the Great Plains of Montana: Montana Agricultural Experiment Station Bulletin 670 (Final contract report), p 18-24, August 1973. 3 fig. USBR Contract 14-06-D-7171.

Descriptors: *Cloud seeding, *Weather modification, *Montana, Ecology, Social impact, Agriculture, *Crop production, *Economic impact, Political aspects, Grasslands, Grazing, Wildlife.

Because the leading industry in Montana is agriculture, the effect of weather modification operations could have an important impact on the economy of the state. Both crop and range condition data were analyzed for precipitation response by the orthogonal polynomial approach. Small grain yield responses varied from a low of 0.5 to a high of 2.2 bushels per acre, depending upon the crop and the assumed condition. Responses for barley were higher than for spring wheat or winter wheat. Range condition responses varied from a low of 3.2 units to a high of 5.7 units, depending upon the assumed condition. Statistical analyses suggested general relations for the Great Plains area of Montana. For the growing season, drought is most usually linked to deficits of precipitation from about May 3 through June 13. For the growing season, abundant precipitation is most usually linked to high precipitation amounts from about May 10 to June 27 and July 19 to August 1, the former period being most important. For the nongrowing season, drought is most usually linked to deficits of precipitation from about September 13 through October 17. For the nongrowing season, abundant precipitation is most usually linked to high precipitation amounts during the period from about September 6 to 19. (See also W74-06442) (Knapp-USGS)
W74-06445

HYDROLOGY IMPACTS: PART I--GROUND WATER HYDROLOGY,
Montana State Univ., Bozeman. Dept. of Sociology.
M. R. Miller, and E. Bond.
In: Impacts of Induced Rainfall on the Great Plains of Montana: Montana Agricultural Experiment Station Bulletin 670 (Final contract report), p 37-42, August 1973. 2 tab. USBR Contract 14-06-D-7171.

Descriptors: *Weather modification, *Hydrogeology, *Montana, Recharge, Water balance, Hydrograph analysis, Mining, Groundwater, Base flow.

The impact that increased precipitation due to cloud seeding would have on the groundwater system in the Great Plains area of Montana was evaluated by hydrograph analysis. As long as present conditions and farming practices continue, allowing the excess moisture to move through the subsoil and till and to contribute water to the seep areas, the problem can only get worse. Also, under the present conditions, increased precipitation due to cloud seeding during the spring months could serve to aggravate the problem, however, if the added precipitation comes during the summer months, available data indicate that it would have very little effect on the saline-seep problem. A disadvantage of increased rainfall during mining operations is that any significant amount of water accumulating in the coal must be removed prior to mining. Perhaps the greatest need for rainfall is after an area is mined and the spoil banks must be reclaimed. Added rainfall would greatly enhance the regrowth of vegetation, although locally there could be some saline problems. (See also W74-06442) (Knapp-USGS)
W74-06446

HYDROLOGY: PART II--SURFACE HYDROLOGY AND GEOMORPHOLOGY,
Montana State Univ., Bozeman. Dept. of Earth Sciences.
J. M. Ashley, Jr.
In: Impacts of Induced Rainfall on the Great Plains of Montana: Montana Agricultural Experiment Station Bulletin 670 (Final contract report), p 43-52, August 1973. 3 fig. USBR contract 14-06-D-7171.

Descriptors: *Weather modification, *Montana, *Erosion, Geomorphology, Soil erosion, Vegetation effects, Precipitation(Atmospheric), Rainfall-runoff relationships.

Most of Montana would be relatively unimpaired by artificial increases in precipitation as long as the natural temporal pattern is duplicated and rainfall intensities are low to moderate. Most soils found in the region are capable of absorbing water at high rates, especially when comparatively dry. Even in areas of great susceptibility to erosion, long-term benefits may substantially outweigh short-term losses, especially if standardized precipitation management programs are adopted as the vegetal cover improves. WAX-TREATED SOILS FOR HARVESTING WATER,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
D. H. Fink, R. Cooley, and G. H. Frasier.
Journal of Range Management, Vol 26, No 6, p 396-398, November 1973. 1 fig, 1 tab, 12 ref.

Descriptors: *Water harvesting, *Soil treatment, *Application methods, Runoff, Evaporation control, *Soil surfaces, Precipitation(Atmospheric), Demonstration watersheds, Water yield improvement, Infiltration rates, *Arizona, Water quality, Ranges, Carrying capacity.
Identifiers: *Paraffin wax, Mesa(Ariz), *Hydrophobic soils.

Water harvesting promises to alleviate water shortages on rangelands that limit livestock-carrying capacity. This study examined the use of paraffin wax applied as flakes or granules to the soil surface. The wax was allowed to melt and spread in the desert sun forming a hydrophobic soil surface, which would allow runoff. The wax-treated plots averaged 90 percent precipitation runoff yield compared to 30 percent on the untreated plots. The quality of the runoff water from the waxed plots was good overall. The experimental watershed plots were located at the Granite Reef test facility near Mesa, Arizona. (Mastic-Arizona)
W74-06457

FLOATING SHEETS OF FOAM RUBBER FOR REDUCING STOCK TANK EVAPORATION,
Agricultural Research Service, Logan, Utah.
A. R. Dedrick, T. D. Hansen, and W. R. Williamson.
Journal of Range Management, Vol 26, No 6, p 404-406, November 1973. 3 fig, 1 tab, 17 ref.

Descriptors: *Evaporation control, *Reservoir storage, *Stock water, *Synthetic rubber, *Costs, Evaporation, Water harvesting, Storage tanks, Water storage, *Utah, *Synthetic rubber.

Evaporation control for stock tanks is investigated using floating sheets of foam rubber. This synthetic rubber is highly resistant to weathering and can be formed into a continuous cover by lap jointing using contact cement. Results of test tanks in Utah showed evaporation reductions of about 75% when 95% of the water surface was covered. Some problems encountered included pecking damage by birds, dust accumulation which plugged some boiling holes, and cover separation due to ice formation. Some modifications have reduced these problems. Estimated cost to save potentially evaporated water in a 4-foot evaporation zone ranges from about $1.80 to $2.00 per 1,000 gallons, with an estimated cover life of approximately ten years. (Mastic-Arizona)
W74-06458

WATER HARVESTING EFFICIENCIES OF FOUR SOIL SURFACE TREATMENTS,
Agricultural Research Service, Laramie, Wyo.
F. Rauzi, M. L. Fairbourn, and L. Landers.
Journal of Range Management, Vol 26, No 6, p 399-403, November 1973. 4 tab, 14 ref.

Descriptors: *Water yield improvement, *Water harvesting, *Soil treatments, *Roofing materials, *Application methods, Soil surfaces, Salts, Runoff, Precipitation(Atmospheric), Snow melt, Storage tanks, Sediments, Gravels, Soil types, *Wyoming, *Colorado, Paving, On-site data collections, Ranges, Plastics.

Efficiencies of four soil surface treatments for water harvesting were studied at the Central Plains Experimental Range, Colorado, and at Gillette, Wyoming, over a 5-year period. The water harvesting system consists of collecting and storing water from land treated to increase runoff. This method can be employed on rangelands in excellent condition, but with little or no available water supply. The four soil surface treatments consisted of salt (NaCl), plastic covered with gravel, asphalt roll roofing, and untreated rangeland. Average water harvesting efficiencies ranged from 5% on rangeland at Gillette to 105% for asphalt roll roofing at the Central Plains Experimental Range. Plastic covered with pea gravel and salt treatments were generally unsatisfactory. The asphalt roll roofing treatment showed the greatest potential for water harvesting quantity and good water quality. (Mastic-Arizona)
W74-06463

NEW DIRECTIONS IN THE CHILEAN NORTH,
Colorado Univ., Boulder. Dept. of Geography.
D. D. MacPhail, and H. E. Jackson.
In: Coastal Deserts, their natural and human environments, ed. by D. H. K. Amiran and A. W. Wilson. University of Arizona Press, Tucson, 1973, p 123-136. 12 fig, 35 ref.

Descriptors: *Deserts, *Arid lands, Land development, Land management, Coasts, Arid climates, Desert plants, Land reclamation, Urbanization, Regional development, Water resources development, Mining, Copper, Agriculture, Fishing, Fisheries, Fish management, Energy, Desalination, Fog, Water harvesting.
Identifiers: *Chile.

The renewable resources of water, energy, fish and soil have become essential in the continuing development of the arid zones of northern Chile. Although water transport provisions have been able to supply sufficient water for current needs, future urban development in the region will depend on solar or diesel powered desalination and the design of commercially usable units to extract moisture from the region's fogs. Currently copper mining and production is the principal economic pursuit of Chile, but since copper is not a renewable resource, planning must be done for the time when it no longer offers the economic support it does in the current unbalanced economy. Research and development of water and energy resources is necessary to be prepared for this economic reorientation. The role of social perception of the area by its inhabitants in regional development is emphasized. A short historic description and an outline of current developments in mining, agriculture, fishing, urbanization, water and energy are included. (Muller-Arizona)

3C. Use Of Water Of Impaired Quality

SALINITY-OZONE INTERACTIVE EFFECTS ON YIELD AND WATER RELATIONS OF PINTO BEAN,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
G. J. Hoffman, S. V. Maas, and S. L. Rawlins.
J Environ Qual. Vol 2, No 1, p 148-152. 1973. Illus.
Identifiers: *Beans(Pinto), Interactive, *Ozone, Phaseolus-Vulgaris, Resistance, *Salinity-ozone interaction, Stomatal, Transpiration, *Crop yield.

The interaction of salinity and ozone on the growth of pinto bean (Phaseolus vulgaris L.) was evaluated in a controlled temperature light room. Salinity treatments having osmotic potentials of -0.4, -2.0, and -4.0 bars were studied in combination with 2-hr daily exposures to 0, 0.15, 0.25 and 0.35 ppm of ozone. Ozone of 0.15 ppm decreased the yield of nonsaline plants nearly 50%; and at 0.25 ppm and higher, no significant yield was obtained. The results were essentially the same for plants salinized to -2.0 bars. At -4.0 bars, the yield at 0.25 ppm was only reduced to half that of the ozone-free treatment. The results indicate no interaction between salinity and ozone below 0.15 ppm. Above 0.15 ppm, however, there is a large interaction. At salinities of -0.4 and -2.0 bar, water-use efficiency decreases as ozone increased. Ozone did not appear to influence leaf water potential or its components.--Copyright 1973, Biological Abstracts, Inc.
W74-06070

CONSUMPTION OF WATER BY THE COTTON PLANT AT DIFFERENT CONCENTRATIONS OF SOIL SOLUTION, (IN RUSSIAN),
S. N. Ryzhov, and N. I. Zimina.
Uzb Biol Zh. Vol 16, No 2, p 20-24, 1972.
Identifiers: *Chlorides, *Cotton, Excretion, *Fertilizers(Mineral), Sap, Soils, *Sulfates, Water utilization(Plants), *Salinity.

The effect of mineral fertilizers was studied in soils with high chloride and sulfate salinity. Cotton was cultivated in Wagner containers. At salination with chlorides, fertilizers promoted crop increase, but efficiency decreased. With sulfates the fertilizer efficiency decreased even more sharply. Under the influence of fertilizers, the productivity of water utilization by the cotton plant increased 3-4 times. With increased fertilization the water utilization increased slowly. The amount of excreted sap decreased sharply with the increase of salinity, but it increased with increased doses of fertilizers. Sap excretion was lower with sulfate salinity.--Copyright 1973, Biological Abstracts, Inc.
W74-06236

CONTRIBUTION TO THE STUDY OF THE ACTION OF WATER-SOLUBLE AND CITRATE-SOLUBLE PHOSPHORIC UNDER ACIDS DIFFERENT MOISTURE CONDITIONS, (IN SERBO-CROATION),
Institute for Soil Research, Belgrade (Yugoslavia).
Z. Popovic, R. Kovacevic-Tatic, and D. Stevanovic.
Agrohemija. 1/2, p 25-35, 1972.
Identifiers: Citrates, *Oats, *Phosphoric acids, Soluble phosphates, *Phosphates, Soil moisture, *Fertilizers.

Pot trials were conducted in which the action of water-soluble and citrate-soluble phosphoric acids on the yield and the content of phosphorus in the seed of spring oats was studied under different moisture conditions. Soil moisture was maintained at 35 or 65% water capacity and the types of soil investigated for productivity were chernozem and smonitsa. P fertilizers are more effective in regions and years with low precipitation. Water-soluble phosphates are a better source of P for plants, particularly under conditions of soil moisture deficiency.--Copyright 1973, Biological Abstracts, Inc.
W74-06315

INTERACTIVE EFFECTS OF SALINITY AND OZONE ON GROWTH AND YIELD OF GARDEN BEET,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
G. Ogata, and E. V. Maas.
Journal of Environmental Quality, Vol 2, No 4, p 518-520, October-December, 1973. 2 tab, 12 ref.

Descriptors: *Air pollution effects, *Ozone, *Salinity, Saline soils, Osmotic pressure, Soil chemical properties, Salt tolerance, *Growth rates, *Crop production.
Identifiers: *Garden beets(Beta vulgaris).

The interactive effects of root media salinity and ambient ozone on injury, growth, and yield of garden beets were determined under controlled environmental conditions. Plants were grown in non-saline and saline nutrient solution cultures having osmotic potentials of -0.4, -4.4, and -8.4 bars respectively, and were exposed 5 weeks to 0.2 ppm ozone for 0 to 3 hours/day. Growth of the nonsaline beet plants was not significantly affected by 0.20 ppm ozone until exposure times exceeded 1 hour/day, although foliar injury in the form of a reddish-purple stipple had developed on mature leaves. Longer ozone exposures produced severe leaf necrosis and reduced the growth of tops and storage and fibrous roots as much as 50, 40, and 67%, respectively. In contrast, foliar ozone injury on plants grown in saline media developed more slowly and the growth of both tops and roots was relatively unaffected by ozone exposures of up to 3 hours/day. The beneficial effect of salinity in reducing ozone damage was offset by the suppressive effect of salinity on the yield of the storage root. (Skogerboe-Colorado State)

THE IMPACT OF CHANGING COST AND QUALITY OF INDUSTRIAL WATER ON TECHNICAL CHANGE AND PLANT LOCATION DECISIONS,
National Bureau of Economic Research, New York.
R. A. Leone, and J. R. Ginn.
In: Proceedings (Vol III), The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 56 p, 6 fig, 9 tab, 3 ref.

Descriptors: *Industrial water, *Water costs, *Water quality, *Water utilization, *Evaluation, *Water demand, Technology, Mathematical models, Prices, Water availability, Decision making, Equations, Systems analysis.
Identifiers: *Impact analysis.

Major shifts in industrial water use technology have been occurring in recent years in the United States. Factors contributing to these changes include: modernization of technological processes in newly added plants; and variations in the price, availability, and quality of water. For example, high effluent treatment costs have caused a dramatic increase in water costs; even with relatively small water demand elasticities, price changes of such magnitude can have a substantial effect on water usage. The effects are described of these changes in the cost and quality of water on technological changes in process design and plant location decisions. The framework within which industry location decisions are made is discussed in an attempt to put the importance of water in proper perspective. A simple, empirically testable model is presented of the demand for water in water-using industries. The model is intended to suggest reduced-form equations that will ultimately be subjected to empirical test. The Cobb-Douglas functional form is chosen for manipulative convenience. The model parameters are empirically estimated to identify the extent to which the demand for water by industry responds to both the changing cost of water and technological change. Empirical findings to date are summarized. (Bell-Cornell)

VENICE MALLOW COMPETITION IN SOYBEANS,
Kansas State Univ., Manhattan. Dept. of Agronomy.
B. J. Eaton, K. C. Feltner, and O. G. Russ.
Weed Sci. Vol 21, No 2, p 89-94, 1973. Illus.
Identifiers: Glycine-max, Hibiscus-trionum, Moisture, Soils, *Soybeans, *Venice mallow, Weeds, *Plant competition.

Competition studies were conducted with soybeans Glycine max (L.) Merr. 'Clark 63' and Venice mallow (Hibiscus trionum L.). One Venice mallow/7.5 cm of soybean row reduced soybean seed yield 632 kg/ha after 85 days competition.

Thirty to forty-cm weed bands in and between soybean rows reduced yields 270-651 kg/ha with 35-40 days of competition. A natural stand of 215 Venice mallow plants/m sq reduced soybean yield 454 kg/ha after 30 days of competition, and competition up to 110 days reduced yield as much as 1490 kg/ha. Weed competition affected the number of pods per soybean plant more than any other seed-yield component, and soybean height was reduced. Soybean yields were reduced more when soil moisture was abundant early in the growing season and limited in late summer than when moisture was limited early in the growing season and above average until soybeans matured.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF SOME FORMS OF NITROGEN FERTILIZERS ON THE DEVELOPMENT AND CHEMICAL COMPOSITION OF THE FLUE CURED TOBACCO AT DIFFERENT SOIL MOISTURE, (IN POLISH),
Instytut Uprawy Nowozenia i Gleboznawstwa, Pulawy (Poland).
Z. Wirowski, and I. Arazna.
Pamiet Pulawski. 49 p, 129-147, 1971. Illus. (English summary).
Identifiers: Carbohydrates, Chemical composition, *Fertilizers, Nicotine, *Nitrogen, Protein, *Soil moisture, *Tobacco.

In field experiments with sufficient N content in the soil, and with an application of 200 q of farmyard manure/ha there was no dependence of yield weight on the applied form of N. The greatest influence on the weight increase of whole plants as well as of leaves, stems and roots, was exerted by higher soil moisture. The greatest plant weights were obtained with CaNO3, urea, NH4NO3 and (NH4)2SO4 in decreasing order. Under the conditions of increased soil moisture tobacco in the blossoming period was the highest after the application of nitrates and urea forms, at the lower moisture on the contrary, urea had the slightest effect on the plant elongation. Calcium and ammonium nitrates had a better influence on the plant weight increase and on elongation, but poorer leaf physical features were observed. The weight of leaves in relation to stems became also lower by 1 to 4%. Ammonium sulfate and urea decreased the percentage of total N, protein and nicotine and increased the content of carbohydrates. In pots with lower soil moisture, leaves contained more total N, protein and nicotine and less carbohydrates.--Copyright 1973, Biological Abstracts, Inc.

NET ASSIMILATION, WATER USE AND MICROCLIMATE OF A MAIZE CANOPY: III. SPECTRAL COMPOSITION OF THE LIGHT INSIDE THE CROP, (IN FRENCH),
Centre de Recherches Agronomiques des Antilles et de la Guyane, Petit Bourg (Guadeloupe).
C. Varlet Grancher, and R. Bonhomme.
Ann Agron (Paris). Vol 22, No 5, p 515-525, 1971. Illus. (English summary).
Identifiers: Climates, Crop, Light, *Maize canopy, Net assimilation, Spectral composition, Water utilization, *Photosynthesis, *Solar radiation.

The net assimilation of the crop depends on the solar radiation intercepted by the leaves. The response of the leaf varies according to the energy and the spectral composition of the light. The spectral composition of the light and especially the ratio of photosynthetically active radiations (400-700 nm) to the near IR radiations from the sun (700-3000 nm) are modified inside the canopy. The spectral composition is expressed in relative value. The basis is the spectral composition of the sunlight as measured upon a horizontal plane above the canopy. The spectral composition of the light of the sunfleck areas is shown. From the relative sunfleck area profile and the spectral composition of the light in sunlit and shaded areas, it is possible to compute the energy which can be used for photosynthesis and the optical properties of the whole canopy.--Copyright 1973, Biological Abstracts, Inc.

THE INFLUENCE OF DRY PERIODS AT VARIOUS STAGES OF DEVELOPMENT: INVESTIGATIONS OF THE WATER ECONOMY IN OATS AND MILLET,
Institutul de Cercetari Pentru Cereale si Plante Tehnice, Fundulea (Rumania).
C. Pintilie, P. Boland, and A. Voemel.
Z Acker- Pflanzenbau. Vol 136, No 2, p 119-138, 1972. Illus. (English summary).
Identifiers: Avena-sativa, *Dry periods, *Millet, *Oats, Panicum-miliaceum, *Water utilization(Crops).

In climatically controlled glass chambers in the phytotron at Rauisch-Holzhausen drought experiments were carried out with oats (Avena sativa L.) as a plant species of humid climates and with the relatively drought-resistant millet (Panicum miliaceum L.) in Mitscherlich vessels with 2 conventional soil types (degraded loess and alluvial loam soils) and in model soils with varying hygroscopic properties. The object was to determine the resistance of the plants to drought periods at different stages of development. By comparing the values for suction pressure of the plants (by Schardakow's method), for the water content of the soil and the yield per plant (in millet) it was possible to make predictions on the utilization of the soil water and the efficacy of renewed watering after drought periods of varying duration and in different stages of the plant's development.--Copyright 1973, Biological Abstracts, Inc.

DEPENDENCE OF PLANT THERMORESISTANCE ON THERMODYNAMIC PROPERTIES OF SOIL MOISTURE, (IN RUSSIAN),
Moscow State Univ. (USSR).
N. A. Muromtsev, Z. G. Magomedov, and Ya. E. Doskoch.
S-Kh Biol. Vol 7, No 4, p 559-564, 1972. Illus. (English summary).
Identifiers: *Lettuce, Moisture, *Oats, Soils, Thermoresistance(Plants), Thermodynamic properties, *Wheat, *Transpiration.

The thermoresistance of plants (wheat, oats and lettuce) depends on the thermodynamic properties of soil moisture, relative transpiration and absorbing force of plant leaves. The decrease of soil moisture content by 1/3 of the initial value (of the total water-holding capacity) conforms to the maximum rise of thermoresistance in plants. Their relative transpiration is maintained at a constant level. The further increase in the soil moisture deficit results in the sharp fall of the relative transpiration and thermoresistance in plants.--Copyright 1973, Biological Abstracts, Inc.

YIELD DETERMINATIONS IN PERMANENT PASTURES AT DIFFERENT LOCATIONS: INTERACTIONS BETWEEN LOCATION AND MANURING INTENSITY, (IN GERMAN),
Bonn Univ. (West Germany). Institut fuer Pflanzenbau.
W. O. Boberfeld.
Z Acker Pflanzenbau. Vol 135, No 4, p 326-337 1972. (English summary).
Identifiers: *Altitudes, Fodder, *Manuring intensity, *Pastures, Rainfall, Temperature, Winter *Grassland yields.

The yield difference in the location group with differing amounts of rainfall is significant. In the location group with different amounts of winter rainfall the yield difference is not statistically significant. At higher altitudes the temperature sequence in the spring clearly exerts a particularly strong influence on the annual yield from grassland. The manuring effect was mostly dependent on location. The degree of effectiveness of a manurial application was particularly high at lower levels of manuring. The mean index for fodder value of the plant populations rose after 2 growing periods with increasing manurial intensity. Injuries to winter survival were found to be related to manurial intensity and altitude.--Copyright 1973, Biological Abstracts, Inc.

PROBLEMS OF CHOOSING IRRIGATION TECHNIQUES IN A DEVELOPING COUNTRY,
Pahlavi Univ., Shiraz (Iran). Dept. of Agricultural Economics.
G. R. Soltani-Mohammadi.
Water Resources Research, Vol 8, No 1, p 1-6, February, 1972. 4 tab, 13 ref.

Descriptors: *Irrigation practices, Economics, *Comparative costs, Computer models, Irrigation engineering, Irrigation design, *Irrigation systems, Surface irrigation, *Sprinkler irrigation.
Identifiers: *Iran, Developing countries.

A linear programing model is developed to select between modern surface and portable or semiportable sprinkler systems for two irrigation projects in Iran. Skilled labor is included in the model as one of the major limiting factors. For the specified conditions and assumptions, a portable or semiportable sprinkler system is indicated to be economically superior to a modern surface irrigation system for the development of new lands. However, in lands where a modern surface irrigation system has already been installed the transformation to sprinkler irrigation is not feasible. A completely automated sprinkler system is not indicated for either set of conditions in Iran. Primitive irrigation was not included in this study because of lack of data. Welfare effects of the choice of techniques are indicated. (Skogerboe-Colorado State)

PHYSICAL MODEL STUDY OF BORDER-STRIP IRRIGATION,
G. A. Jobling, and A. K. Turner.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 99, No IR4, p 493-510, December, 1973. 14 fig, 1 tab, 20 ref.

Descriptors: *Hydraulic models, *Infiltration, *Infiltration, *Irrigation systems, Hydraulics, Model studies, Roughness(Hydraulic), Surface irrigation, Uniform flow, Water distribution(Applied).
Identifiers: *Border-strip irrigation.

A physical model of an irrigation border was constructed and tested. Equations are developed which describe the profile of the water advancing down the border, the rates of advance, and recession after the inflow is cut off, in terms of inflow, infiltration, slope, and surface roughness. These equations are simplified to a form more suitable for use in design. An illustrative analysis is done to determine correct inflows and cutoff times needed to uniformly irrigate to a desired depth. (Skogerboe-Colorado State)

THEORETICAL IRRIGATION TAILWATER VOLUMES,
Texas A and M Univ., Lubbock. Agricultural Research and Extension Center.
O. C. Wilke.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 99, No IR3, p 415-420, September, 1973. 1 fig.

Descriptors: *Irrigation, *Agricultural runoff, *Irrigation practices, Irrigation design, *Tailwater, Furrow irrigation, Irrigation systems, Surface runoff.

A volume balance theory and graphical relationships for predicting irrigation tailwater volumes are presented. An equation is derived for determining tailwater pumping rates for the case where tailwater is continuously recirculated. Dimensionless graphs illustrate the effects of the time period of runoff on both runoff volumes and irrigation uniformity. Use of this information could improve the management of furrow irrigation systems and also aid in the design of tailwater pits, pumps, and return pipelines. (Skogerboe-Colorado State)

THE FISH-MEAL INDUSTRY OF IQUIQUE,
Universidad Catolica de Valparaiso (Chile). Departamento de Geografia.
M. R. Salinas.
In: Coastal Deserts, their natural and human environments, ed. by D. H. K. Amiran and A. W. Wilson. University of Arizona Press, Tucson, 1973, p 137-146. 5 fig, 5 tab, 16 ref.

Descriptors: *Fishing, *Commercial fishing, *Fish harvest, *Fish conservation, Fish management, Fish populations, Fish handling facilities, Aquatic productivity, Food chains.
Identifiers: Fish-meal, *Chile(Iquique), Anchovy.

As the nitrate mining industry of northern Chile faded out, its place was taken by the fishing industry, patterned after the successful operations in Peru, and prompted by high world market prices for fishmeal. The most viable of the locations in Chile appeared to be at Iquique, where economic, geographic, social and industrial conditions were favorable. In addition, unemployed manpower from the mines was available. A significant increase in the standard of living has resulted, as well as a widening of associated employment opportunities. However, the recent disatrous disappearance of the anchovy upon which much of this industry was based has created a set-back from which the industry can recover only through more intelligent management and reorganization in terms of financial and structural changes, fishing fleet range limitations, diversification of fishing and processing, and technical improvements. There appears to be enough evidence of such improvements that the industry will recover and reestablish its recent prosperity. (Muller-Arizona)

GROUND WATER PROBLEM AT NIOBRARA, NEBRASKA AND THE NIOBRARA STATE PARK (FINAL ENVIRONMENTAL STATEMENT).
Army Engineer District, Omaha, Neb.
Available from National Technical Information Service, Springfield, Va, 22151, as EIS-NB-72-1230-F, $6.25 in paper copy, $1.45 in microfiche. April 1973. 103 p, 7 fig, 1 tab, 3 plate.

Descriptors: *Water levels, *Drainage effects, *Watershed management, *Area redevelopment, *Seepage, *Sediment-water interfaces, Flood control, *Nebraska, Environmental effects, Legislation, Soil water movement, Water control, Government finance, Project planning, Community development, Social impact, Dredging, Levees, Public health, Safety.
Identifiers: *Environmental impact statements.

The federal Flood Prevention Act authorizes the Army Corps of Engineers to resolve the seepage and drainage problems in the Niobrara, Nebraska vicinity. The most feasible and desireable means to alleviate the problem would be to relocate Niobrara and to purchase Niobrara State Park. The citizens voted to reestablish their households and businesses in a new townsite and the state desires that the park be purchased. As the project has special Congressional authorization and is not amenable to the standard economic analysis, no benefit-cost ratio was calculated. Although relocation would change land uses, cause inconvenience, increase expenses and result in the loss of the state park as a tourist attraction, the current health, safety, and nuisance conditions threatening the residents because of the high water conditions would be alleviated. Alternative plans were considered, including levees and wells for ground water control, or the return to pre-project conditions by dredging and reduction of the normal operating level at Gavins Point Dam, but all appeared to have worse environmental consequences and higher economic costs, as well as being unacceptable to the citizens concerned. Measures to mitigate loss of environmental attributes are included in the relocation plan. (Sutton-Florida)

BURNT CREEK RC AND D MEASURE FOR FLOOD PREVENTION (FINAL ENVIRONMENTAL STATEMENT).
Soil Conservation Service, Bismarck, N. Dak.
Available from National Technical Information Service, Springfield, Va, 22151, as EIS-ND-73-1219-F, $4.25 in paper copy, $1.45 in microfiche. June 1973. 34 p, 3 map, 1 tab, 3 append.

Descriptors: *North Dakota, *Flood protection, *Flood damage, *Water resources development, Recreation, Irrigation programs, Agricultural engineering, Acreage, Crop production, Adoption of practices, Drainage, Water conservation, Engineering structures, Flood control, Irrigation systems, Flood routing, Runoff, Snowmelt, Check structures, Dikes, Dams, Precipitation, Project planning, Cost-benefit analysis, Direct costs, Direct benefits, Environmental effects, Wildlife conservation, Cultivated lands.
Identifiers: *Environmental Impact Statements, *Burleigh Co.(N.D.).

A resource conservation and development project in North Dakota will reduce flooding on about 2,500 acres of agricultural land and on a sparsely settled rural residential area. The improvements consist of floodwater diversion, dikes, grade control structure, a structure to divert low flows to Burnt Creek, and an inverted siphon to carry irrigation water across the diversion. The project will destroy 25 acres of vegetation and herbaceous cover, but five acres of similar land will be dedicated. The project will also provide for the maintenance of the integrity of the existing Burnt Creek channel and for use of the flood diversion berm and dikes by wildlife. Practically all the land in the watershed is privately owned and used for agriculture. Five-hundred additional acres of cropland will be irrigated after the project. There are no developed public recreation facilities in the area nor are there any private lands for this purpose. Crops have been damaged by floods in the area for the last thirty-one years. In addition to these summer rainstorm produced floods, spring snowmelt runoff causes additional problems by delaying land preparation for seeding. (Sperling-Florida)

KILLER FROM THE BOTTOM OF THE SEA,
E. P. Weigel.
NOAA, Vol 4, No 1, p 30-35, January 1974.

Descriptors: *Tsunamis, *Warning systems, Flood forecasting, Waves(Water), Ocean waves, Earthquakes.

On September 16, 1973, the National Weather Service accepted responsibility for the U.S. Tsunami Warning System. Tsunamis are ocean waves generated by underwater disturbances in the earth's crust--usually earthquakes but sometimes submarine volcanic eruptions. The waves speed silently across the open sea at up to 600 miles an hour and sometimes wreak havoc on coastal areas thousands of miles away. The warning system is based on, first, the detection and pinpointing of an earthquake big enough and in the right place to cause a tsunami and, second, the identification by tide gages of ocean waves generated by that earthquake. A tsunami watch is issued when the proper-category earthquake is detected. A tsunami warning is issued when the presence of seismic sea waves is confirmed. Included in the warning are quite precise forecasts of arrival times for the first wave of the tsunami at populated points in and around the Pacific basin. (Knapp-USGS)

NUMERICAL SIMULATION OF TSUNAMIS,
Hawaii Inst. of Geophysics, Honolulu.
C. L. Mader.
Report HIG-73-3 (NOAA-JTRE-85), February 1973. 48 p, 30 fig, 10 tab, 9 ref, 2 append.

Descriptors: *Tsunamis, *Mathematical models, *Simulation analysis, Barriers, Ocean waves, Beaches, Waves(Water), Earthquakes, Computer programs.

Two-dimensional, time-dependent, nonlinear, incompressible, viscous flow calculations were used to form realistic models of tsunami waves interacting with continental slopes and shelves. Wave heights grow by a factor of 4 as they shoal up a 1/15 continental slope. The second or third wave often exhibits the largest wave runup. In comparisons with shallow water, long wave calculations show similar results except for short wavelength tsunamis. The damping action of submerged barriers on tsunami waves was also investigated. Significant amounts of the energy of a tsunami may be reflected by submerged barriers. Numerical simulation of tsunami waves can provide realistic descriptions of their flow. (Knapp-USGS)

APPROXIMATE SOLUTION FOR UNCONFINED SEEPAGE,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
C. S. Desai.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 99, No IR1, p 71-87, March, 1973. 12 fig, 24 ref.

Descriptors: *Drainage, *Finite element analysis, *Free surfaces, Interfaces, Irrigation, Numerical analysis, *Seepage, Transition flow, Unsteady flow.

An approximate solution procedure using the finite element method is developed for one-dimensional unstready free surface seepage. The numerical results are compared with experiments on a viscous flow model and with analogue solutions. Satisfactory correlation is obtained between the numerical and experimental results. Results from the proposed procedure based on one-dimensional formulation are compared with those from two- and three-dimensional formulations. Numerical properties of the proposed procedure with respect to timewise and spatial discretizations, magnitudes of permeability, and use of higher order approximating functions are analyzed. The proposed solution can provide satisfactory and economical solutions for many practical problems that can be idealized as one-dimensional. (Skogerboe-Colorado State)

PREFABRICATED FILTER-FIN FOR SUBSURFACE DRAINS,
Connecticut Univ., Storrs. Dept. of Civil Engineering.
K. A. Healy, and R. P. Long.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 98, No IR4, p 543-552, December, 1972. 5 fig, 1 tab, 5 ref.

Descriptors: *Drainage, *Drainage practices, Drainage systems, *Filters, Drainage engineering, Tile drainage, Subsurface drainage, Drains, Filtration, Seepage, Slope stabilization.
Identifiers: Fins, Underdrains.

The design and methods of installation of a prefabricated filter media for use with subsurface drains are presented. The filter media is fabricated from synthetic materials and can be used without special backfill. Methods of installing the prefabricated system in trenches and slopes are described. Results are presented from five field test installations containing a total length of 2,500 feet (762 m) of prefabricated underdrain. Costs for the underdrains are shown, and potential economics for slope stabilization and land drainage are indicated. (Skogerboe-Colorado State)

SEQUENTIAL DETERMINISTIC OPTIMIZATION IN RESERVOIR OPERATION,
Iowa Univ., Iowa City Inst. of Hydraulic Research.
T. E. Croley, II.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY3, Proceedings paper No 10426, p 443-459, March 1974. 4 tab, 21 ref. NSF GK-11564.

Descriptors: *Reservoir operation, *Optimization, *Computer models, *Dynamic programming, Methodology, Hydraulics, *Simulation analysis, Economics, Equations, Mathematical models, Systems analysis, Reservoir storage, Data processing.
Identifiers: Computation, Statistical analysis, *Deterministic optimization, Search techniques.

Computer simulation plays a weighty role in the optimum planning and operation of reservoir systems. As planning and operating needs for more complex systems grow, the demand on computational facilities increases. Reduction of computation in reservoir operation optimization problems can be made through a modification of the optimization technique rather than through limiting the development of the system models. Considerations are presented which lead to the development of a modified application of deterministic optimization techniques; the modification, optimization over reduced operation horizon at each stage, allows for reduction of computation without simplifying the problem while achieving results that approximate the optimum. In addition, these considerations result in several specific advantages associated with particular optimization techniques. Insight is given into these considerations, and resulting modifications to be made to applications of optimization techniques are presented. In an example problem, the modified application of dynamic programming is made for a single reservoir system illustrating the technique and the achievement of near optimum performance. (Bell-Cornell)

ALTERNATIVE WATER RESOURCE SYSTEMS IN THE LOWER MEKONG,
Economic Commission for Asia and the Far East (UN), Bangkok (Thailand). Mekong Committee Secretariat.
K. Chaemsaithong, L. Duckstein, and C. C. Kisiel.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY3, Proceedings paper No 10430, p 461-475, March 1974. 3 fig, 2 tab, 28 ref.

Descriptors: *Evaluation, *Decision making, *Alternative planning, *Water resources development, *Flood control, *Hydroelectric power, *Agriculture, Costs, Environment, Systems analysis, Mathematical models, Irrigation.
Identifiers: Cost-effectiveness, Sensitivity analysis, Economic analysis, *Mekong River Basin, Developing countries, Uncertainty, Impact, Systems engineering.

The particular problems of water resource system design in developing countries are illustrated through presentation of a systematic method to evaluate alternative water resources systems, using a central portion of the Lower Mekong Basin as an example. The method is Kazanowski's cost-effectiveness approach, used here to evaluate two alternative water resource systems designed to reach social and economic goals. The fallacies encountered in benefit-cost analysis are given, and the advantages of Kazanowski's method are discussed and the approach is outlined in 10 steps. These 10 steps are then discussed in detail in applying the method to the Lower Mekong Basin. In the evaluation process, the development goals that may be of an economic or social nature are stated explicitly and are transformed into specifications. The approach requires that distinct alternatives be sought and compared using both quantitative and qualitative criteria. The alternative systems for the Lower Mekong Basin are defined as systems consisting of structural projects, such as dams and reservoirs including spillways, powerhouses, dikes, and irrigation systems at different locations. A decision to select an alternative can be reached by use of a fixed-cost or fixed-effectiveness approach. Sensitivity analysis in the approach accounts for uncertainty in hydrologic and economic data. (Bell-Cornell)

THE OPTIMUM DEVELOPMENT OF WATER RESOURCES IN A RURAL SETTING,
North Dakota State Univ., Fargo.
D. O. Anderson.
In: Proceedings (Vol III), The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 46 p, 8 fig, 2 tab.

Descriptors: *River basin development, *North Dakota, *Rural areas, Methodology, Long-term planning, *Comprehensive planning, *Linear programming, Water supply, Optimization, Alternative planning, Economic efficiency, Agriculture, Systems analysis, Mathematical models, *Optimum development plans.
Identifiers: *Knife River Basin(N. Dak), Separable programming.

Presented are two methodological approaches to water and related land resources planning with specific application to rural America. Considered is the adoption of a progressive water plan and development program for optimum utilization of water resources in North Dakota, known for its wide fluctuations in economic activity, climate and social structures. The optimum plan must consider simultaneously all physical, economic, legal, environmental, and social characteristics and goals, possessing the flexibility for continual revision as changes occur. The Knife River Basin, an area devoted chiefly to farming and ranching, was chosen for study. The first of the two methodological approaches is a mathematical model which combines linear and separable programming. Since water supply is the most limiting natural resource, the optimum development plans maximize returns to water, and the problem becomes one of determining the combination of dams, pumps, and other

structures along with the most profitable uses that would give the greatest net dollar benefit from water available in the Basin. The second approach, a people-oriented systems design, is an effective methodology for the formulation of plans to develop and manage water resources for hydrological areas of various sizes and for bringing together the expertise of a wide range of disciplines to solve complex problems. Solution is accomplished by systematic assembly and matching of knowledge on all parameters of the problem in order to solve the entire problem simultaneously. (Bell-Cornell)

DRAINING AND RECLAMATION OF SWAMPY FOREST LANDS, (IN RUSSIAN),
M. M. Elpat'evskii, M. P. Elpat'evskii, and V. K. Konstantinov.
Lesnaya promyshlennost': Moscow. 1970. 232 p. Illus.
Identifiers: *Forest planting, *Swampy lands, *Drainage, *Land reclamation.

The characteristics of the total forest area intended for ameliorarion, the condition and the prospects of forest draining development are presented. The experience of advanced farms and those in other countries, the methods and the evaluation of forest draining efficiency are described. Data are given on the draining of cutting areas. Norms of draining, and problems of fertility of swampy soils and the causes of the absence of forests on swamps are also presented. The principles of agricultural technique and technology are examined for the reclamation of swamps by forest planting.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: USSR, Egypt, India.

Five fundamental desert regions of the Old World are identified in the USSR, Egypt, and India, where annual precipitation varies from 21 mm (Suez) to 347 mm (Bhuj, India). Sand and solonchaks, described as the two predominant soil types in these coastal deserts, are contrasted by comparing the predominant vegetation types of each of these soils. Due to their coastal location these deserts experience high atmospheric moisture conditions on their seaward areas. This seems to be the primary contribution to soil moisture in many areas. Trees that can be grown successfully under these conditions in each desert are listed. Groundwater availability is also discussed. The reclamation of these desert soils for agriculture has potential for product yield increase. The mineral or salinity control of the solonchak soils is necessary for their successful reclamation by making the fresh groundwater horizon accessible to the root systems. The USSR's 'trench farming' method to achieve this is described. The crops which may be cultivated in such areas are listed. (Muller-Arizona)

CLIMATIC-GEOMORPHOLOGICAL ZONES AND LAND UTILIZATION IN THE COASTAL DESERTS OF THE NORTH SAHARA,
Stuttgart Univ. (West Germany). Geographisches Institut.
W. Meckelein.
In: Coastal Deserts, their natural and human environments, ed. by D. H. K. Amiran and A. W. Wilson. University of Arizona Press, Tucson, 1973, p 159-165. 1 fig, 1 tab, 14 ref.

Descriptors: *Arid climate, *Climatic zones, *Coasts, *Land use, Land classification, Land resources, Land management, Regional economics, Topography, Precipitation(Atmospheric), Deserts, Semiarid climates, Soils, Geomorphology.
Identifiers: *Shara Desert.

In the northernmost extent of the Sahara Desert bordering on the Mediterranean Sea, from Tunisia to Egypt, three climatic meteorological zones are apparent. The first occupies part of the Tunisian and Tripolitanian Jebel, with over 300 mm per year precipitation on terra rossa soils. The second zone is transitional between the Mediterranean climate of the first zone and the subtropical dry climate of the third, with 200 mm per annum or less precipitation. The semidesert climate of the third zone is the last area in which the influences of the Mediterranean Sea may be observed. Present land utilization is as diverse as the land, with agriculture and animal husbandry predominating. The potentials for food producing land utilization are discussed for each of the zones. The importance of using geographical methods in order to recognize the combination of natural factors in an arid region which influence land utilization is stressed. The optimization of returns from agriculture and animal husbandry is dependent on the extent to which these interrelationships are realized and accommodated. (Muller-Arizona)

Identifiers: *South Africa, *Angola.

The Namib Desert occupies the southwest coast of Africa from Mossamedes in Angola to the Olifants River of South Africa, but extends only about 100 miles inland. It is made up principally of large sand plains with gravel or bedrock flats, and bare rock mountains. The climate is cool and the humidity high, with coastal fogs common, but the land is almost completely rainless. The area has been traditionally inhabited by tribes of bushmen, but modern man is making inroads into the region. Fisheries are established along the coast, with their associated industries and ports (of which one is capable of handling oceangoing vessels). Urbanization has occurred in conjunction with these ports. Diamond mining, salt production, cattle and sheep grazing, tourism, and extremely limited agriculture are currently the foundations of the economy. Water is available only as underflow in the sands of streams and riverbeds. Up to now, this has been sufficient for the small-scale farming which is carried on in two locations. While the Namib appears to offer little potential for future development, fishing and port commerce plus a growing tourism can create substitutes for a dangerous encouragement toward marginal agricultural development dependent on an uncertain and inadequate water supply. MANAGEMENT OF PROTECTION FORESTS IN WESTLAND,
New Zealand Forest Service, Hokitika.
M. F. O'Reilly.

N Z J For. Vol 17, No 2, p 274-279, 1972. Illus.
Identifiers: *Erosion, Floods, *Forest management, Mountains, *New Zealand(Westland), *Soil stabilization, Coastal plains.

Over 60% of the total land area of Westland, New Zealand, is mountainous country bordering the narrow coastal plain. The mountains rise to heights of 1200 to 3650 m in as little as 12 km from the sea. Over 30 major rivers run down through the coastal plain. These mountains are largely forest-clad up to about 1000 m. The forests and other vegetation are subject to damage from browsing and grazing animals and, to a less extent, fire. The prime objective of management must be to stabilize mountain soils and regulate river flows, to minimize flood and erosion damage to downstream areas. Management for scenic, tourist and recreational use is becoming an increasingly import secondary objective. Thus, while the forest must be maintained in a condition in which they can fulfill their primary protective function most efficiently, their value as scenery, and their use for recreation and sport must be considered. In addition, the role of commercial meat hunters in contributing towards animal control must also be taken into account. It is important that the primary objective does not become obscured because of pressure from sectional groups in their own particular interest.--Copyright 1973, Biological Abstracts, Inc.

ON WATER RESOURCE CONDITIONS IN THE VICINITY OF PINELLAS COUNTY'S ELDRIDGE WILDE WELL FIELD,
Southwest Florida Water Management District, Brooksville.
G. Parker.
Hydroscope, Vol 4, No 4, May/June 1973. 4 p, 8 fig, 1 map.

Descriptors: *Water wells, *Subsurface waters, *Aquifer systems, *Aquifer management, Water sources, Water storage, Groundwater, Groundwater recharge, Saline water intrusion, Subsurface investigations, Natural recharge, Potentiometric level, Florida, Water resources, Dredging, Pumping, Irrigation, Water levels.

Pinellas County's Eldridge Wilde Well Field consists of about 2.8 square miles of land in northeastern Pinellas County and northwestern Hillsborough County, Florida. When put into service in 1956 its average pumpage was 5.7 million gallons per day (mgd), but with rapidly expanding water demands, the average pumpage had risen to 43.56 mgd in May, 1973. The largest customers are the cities of Clearwater, Tarpon Springs, Largo, Safety Harbor, and Pinellas Park. The average direct recharge to the aquifer is about .650 mgd per square mile; it requires 65.5 square miles of land to supply the current average-day's pumping. This is an area almost 23 1/2 times larger than the existing field. This pumping has created a widespread cone-of-depression around the well field. Drought effects are a principal cause of lowered waters since during dry periods most water pumped is used for irrigation. The current drought is the worst recorded in the area with below average rainfall in ten of the last twelve years. The other major cause of water level lowering is the dredging of both natural streams and man-made channels, which also cause saltwater intrusion. (McKnight-Florida)

INVESTIGATIONS--GEOLOGY AND GROUNDWATER RESOURCES, VICINITY OF CASTLE ROCK, COWLITZ COUNTY, WASHINGTON,
Washington State Dept. of Ecology, Olympia. Office of Technical Services.
C. Cline.
Technical Report 73-010, July 1973. 9 p, 4 fig, 1 ref.

Descriptors: *Aquifer testing, *Water yield, *Washington, Hydrogeology, Drawdown, Specific capacity, Alluvium, Sandstones, Groundwater, *Pumping.
Identifiers: Kelso(Wash).

A pumping test was made on a well soon to be destroyed because of a planned right-of-way to Interstate Highway 5 near Kelso, Washington. The well produced water from the Eocene sandstone. It was drilled to 163 feet in July of 1949 and was cased to 54 feet. A bailer test made at that time could yield only 6 gpm over a 1-1/2 hour period. The specific capacity of the well is approximately 0.06 gallons per minute per foot of drawdown. The bailer test conducted by the driller on the replacement well indicates that 50 gpm could be pumped from this well with only a 17 foot drawdown after pumping for two hours. (Knapp-USGS)

GROUNDWATER MANAGEMENT,
California State Dept. of Water Resources, Sacramento. Div. of Resources Development.
H. J. Peters.
Water Resources Bulletin, Vol 8, No 1, p 188-197, February, 1972. 1 fig.

Descriptors: *Water management(Applied), *Surface-groundwater relationships, *Groundwater resources, Groundwater potential, Water utilization, Aquifer management, Base flow, Groundwater, Surface water, *Conjunctive use.

Groundwater management concepts have changed over the years, with today's concept a comprehensive integrated use of the four groundwater resources with surface water resources to provide the most efficient water service for an area in terms of quantity, quality, and cost. Complete geologic and hydrologic understanding provides a base for formulation of plans which can utilize the techniques of artificial recharge, control of sea water intrusion, and variation of pumping patterns while protecting the resources through proper well construction and abandonment, placement of sanitary landfills, and liquid waste disposal. Plan formulation involves varying recharge and extraction amounts while maintaining the total of pumped groundwater and developed surface water equal to the projected demand. Physical limitations of the system must be recognized to assure reality of the plans. Legal constraints should not be placed on the plan formulation process. A present worth or other technique is used to provide an economic comparison among plans. Implementation will entail development of legal and organizational structures, with the most difficult problems relating to the management organization in terms of boundaries and powers. (Skogerboe-Colorado State)

TENSIOMETER USE IN SHALLOW GROUNDWATER STUDIES,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
S. J. Richards, L. S. Willardson, S. Davis, and J. R. Spencer.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 99, No IR4, p 457-464, December, 1973. 7 fig, 7 ref.

Descriptors: *Drainage, *Groundwater, Measurement, Piezometers, Pore water, Pore pressure, Seepage, *Tensiometers, *Water table, Wells.

Tensiometers installed with a ground surface or other reference can be used to determine groundwater equipotentials and the position of the water table in the field. Tensiometer determined water tables were roughly comparable to those measured with perforated wells in a sprinkler irrigated Coachella fine sandy soil. Water differences depended on the flow conditions and proximity of the tensiometers to a drain. Shallow groundwater equipotentials can be determined above and below the water table with a tensiometer system. (Skogerboe-Colorado State)

THE CITY OF FRESNO'S LEAKY ACRES GROUND-WATER RECHARGE PROJECT--CONSTRUCTION AND PERFORMANCE,
Agricultural Research Service, Fresno, Calif. Ground Water Recharge Field Station.
W. C. Bianchi, and G. J. Lang.

Journal of the American Water Works Association, Vol 66, No 3, p 176-180, March 1974. 8 fig, 4 tab, 3 ref.

Descriptors: *Water spreading, *Artificial recharge, *California, Water treatment, Hydrogeology, Alluvium, Cities, Urbanization, Irrigation practices.
Identifiers: *Fresno(Calif).

The urban-area hydrology and geologic setting of Fresno, Calif., produces groundwater depressions that require stabilization. Artificial groundwater recharge by water spreading on selected agricultural soils can be operationally and economically successful for urban water supply. Construction, structures, and water-control operations are closely related to agricultural irrigation practice. Artificial recharge can be accomplished into the Fresno depression at a total cost of $25.00-$25.50/acre-ft (at the mains) by water spreading in the urbanized area. This is about half of what filtration and treatment would cost. The actual cost of water spreading amounts to only $2.50-$3.00/acre-ft, with the rest going to water purchase and pumping costs to put the water into the city's mains. (Knapp-USGS)

SUMMARY OF WATER-LEVEL AND PUMPAGE DATA IN THE CHEYENNE AND FEDERAL MUNICIPAL WELL FIELDS, APRIL 1, 1972 TO APRIL 2, 1973, CHEYENNE, WYOMING,
Geological Survey, Cheyenne, Wyo.
B. H. Ringen.
Basic-data report, October 1973. 27 p, 11 fig.

Descriptors: *Water levels, *Water yield, *Groundwater, *Wyoming, Hydrologic data, Data collections.
Identifiers: *Cheyenne(Wyo).

Water-level data were collected April 1, 1972 to April 2, 1973 for the Cheyenne and Federal municipal well fields by the U.S. Geological Survey, in cooperation with the city of Cheyenne. Pumpage data for these well fields, April 1, 1972 through March 31, 1973, were provided by the city of Cheyenne. Water levels were measured monthly in selected wells in the Cheyenne and Federal municipal well fields. In addition, graphic water-stage recorders were operated on three observation wells in the Cheyenne municipal well field. (Knapp-USGS)

Descriptors: *Groundwater, *Loess, *Washington, *Glacial drift, Aquifer testing, Water yield, Water quality.
Identifiers: *Spokane County(Wash).

Groundwater conditions were studied near Plaza, Spokane County, Washington, to ascertain the availability of groundwater. A pump test was conducted to obtain specific information about one well's behavior. Water samples were collected for quality analysis. The two geologic units which are of primary interest are the eolian deposits and the scabland deposits. In general, the water-bearing characteristics of these units are fairly predictable and are determined by primary properties such as grain size and rock type. A real differences are caused by secondary properties such as the degree of compaction, cementation, weathering, and erosion. The porosity of the loess is high and, where saturated, it contains large volumes of water. However, the hydraulic conductivity is low. Scabland deposits are gravels, sands, and silts of glaciofluvial origin. This unit lies directly on the basalt and has good hydraulic conductivity. Over the 2-hour pump test, the well yield was approximately 600-650 gallons. Based on a need of 200 gallons per day per person in the household, this well will produce the amount required (600 gallons per day for a 3 member family) over a 24-hour period. (Knapp-USGS)

Vestnik Moskovskogo Universiteta, Seriya V, Geografiya, No 2, p 106-112, March-April 1972. 5 fig, 3 tab, 12 ref.

Descriptors: *Artificial recharge, *Groundwater recharge, *Groundwater, *Surface runoff, Hydrogeology, Aquifers, Recharge wells, Seepage.
Identifiers: *USSR(European region).

Artificial replenishment of groundwater storage by regulation of local runoff was investigated in central Chernozem regions of the European USSR. The most importan hydrogeological characteristics determined were thickness and permeability of the zone of aeration, location of the upper aquifer, and direction and rate of groundwater movement. A part of the local surface runoff in central Chernozem regions and in many regions in the European south of the USSR can be used as the primary source for artificial recharge, and the gully-ravine network can serve for building seepage reservoirs. To study artificial recharge conditions over large expanses, the method of representative areas can be used. This method includes a geological, geomorphological, and hydrogeological regionalization, selection of representative areas on the basis of geomorphological, hydrogeological, and hydrologic characteristics, and observations in the areas selected. Recommendations on location and operation of wells in artificially replenished groundwater areas are tabulated. (Josefson-USGS)

DISTINCTIVE HYDROGEOLOGICAL CHARACTERISTICS OF SOME PAMPAS OF THE PERUVIAN COASTAL REGION,
Sao Paulo Univ. (Brazil). Dept. of Geology.
P. Taltasse.
In: Coastal Deserts, their natural and human environments, ed. by D. H. K. Amiran and A. W. Wilson. University of Arizona Press, Tucson, 1973, p 109-110. 4 ref.

Descriptors: *Hydrogeology, *Groundwater, *Aquifers, *Coastal plains, Groundwater availability, Alluvial aquifers, Aquifer systems, Areal geohydrology, Subsurface water, Wells, Water sources, Reservoirs, Recharge, Water storage, Water supply, Water table, Aquifers, Groundwater basins, Hydrologic aspects, Springs, *Grasslands.
Identifiers: *Peru.

The coast of Peru from the Sechura desert to the valley of the Rio Yauca is occupied by a sedimentary plain known as the pampas. Recently groundwater aquifers have been discovered in this area. Wells with relatively high yields have been established in the pampas for agriculture. These initial holes indicate that a more extensive groundwater system may exist under the pampas, and that some of the aquifers discharge into faulted complexes of metamorphic rocks. The actual extent of this aquifer is not known nor is there an estimate of the amount of water stored, but if the preliminary findings are indicative, the groundwater of the area will be a significant input into the agriculture of the region in terms of increased economic returns. IMPACT OF MINING GRAVEL FROM URBAN STREAM BEDS IN THE SOUTHWESTERN UNITED STATES,
Arizona Univ., Tuscon. Dept. of Geosciences.
W. B. Bull, and K. M. Scott.
Geology, Vol 2, No 4, p 171-174, April 1974. 3 fig, 1 tab, 14 ref.

Descriptors: *Alluvial channels, Gravels, *Sands, *Quarries, *Urban hydrology, Scour, Stream erosion, Construction materials, Channel morphology, *Southwest U.S.
Identifiers: Urban streambeds, *Gravel mining.

Large amounts of sand and gravel are excavated from stream channels, which are a convenient source of high-quality aggregate. Such mining has a potential impact both on the stream system from which the gravel is taken and on engineering structures in the vicinity of the stream. Urbanization changes the rates at which water flows into stream channels and affects the erosion of soils that furnish the suspended load and bed load. The net effect of these activities in many southwestern cities is to increase flood peaks, decrease low-flow discharges, and increase sediment loads greatly during periods of community construction. Although the mining of sand and gravel in stream channels causes minimal changes in water and sediment discharge, several other effects are common. The removal of sand and gravel from a streambed pit causes a local lowering of the streambed that results in overall downcutting of the channel upstream from the mining operation. When aggregate is removed from many locations along a stream, the removal of sand and gravel generally exceeds the rate of replenishment of sand and gravel from the urban and natural watershed. The consequent lowering of the streambed increases the potential for undermining bridge piers during times of major streamflow, when maximum scour occurs. Deepening of the stream channel as a result of gravel mining also tends to increase channel capacity, because more of a floodflow will remain in the channel after channel deepening than before. However, channel deepening also has the adverse effect of making the streambanks more susceptible to erosion. Streambed mining may reduce recharge to the groundwater table. (Knapp-USGS)

A LITERATURE REVIEW OF TIMBER-HARVESTING EFFECTS ON STREAM TEMPERATURES: RESEARCH NEEDS FOR THE SOUTHWEST,
Forest Service (USDA), Tempe, Ariz. Forest Hydrology Lab.
D. R. Patton.
USDA Forest Service Research Note RM-249, November 1973. 4 p, 26 ref.

Descriptors: *Water temperature, *Southwest U.S., Reviews, *Clear-cutting, *Cutting management, *Forest management, *Lumbering, Runoff, Watershed management, Environmental effects, Aquatic habitats, Water quality standards, Research priorities.
Identifiers: Fish habitats.

Literature on the effects of timber harvest on water temperature is reviewed. Water temperature affects fish by changing their metabolic rate, changing oxygen content of water, influencing hatching and development time, and influencing migration. Creating a more open forest in the water-producing zone can change water temperature in shallow, low-volume streams. Research is needed on how timber harvesting affects water temperature to produce guidelines to meet Federal Water Pollution Control standards for cold-water fish. (Knapp-USGS)

THE EFFECT OF LOGGING ON HILL DIPTEROCARP FOREST,
Forest Research Inst., Kepong (Malaysia). Colombo Plan.
P. F. Burgess.
Malay Nat J. Vol 24, No 3/4, p 231-237. 1971.
Identifiers: *Dipterocarp forests, Erosion, *Forests, Hills, Roads, Wildlife, *Lumbering.

The Malaysian rain forest is of so mixed a constitution that only a relatively small proportion is marketable. Of the 2500 species of trees there are only about 700 spp. which reach a size large enough for timber use. The trees which are felled are usually those with large crowns, which when they fall cause considerable damage to the lower stories of the forest. The greatest damaging factor in hill forest timber operations is probably road making. Erosion is extensive and records show that one area was scoured to a depth of 12 feet in one monsoon season. In some areas erosion causes extensive landslides. It has been estimated that 48% of the mammals move out of forests being logged. Scientific information is needed to determine the total extent to which logging affects different soil and topography types and to find the length of time during which this erosion continues.--Copyright 1973, Biological Abstracts, Inc.

4D. Watershed Protection

LITTLE CREEK WATERSHED PROJECT, LAURENS AND WHEELER COUNTIES, GEORGIA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Soil Conservation Service, Athens, Ga.
Available from National Technical Information Service, Springfield, Va, 22151, as EIS-GA-73-0657-F, $4.00 in paper copy, $1.45 in microfiche. March 1973. 41 p, 3 map, 1 tab.

Descriptors: *Alternative planning, *Cost-benefit ratio, *Multiple-purpose projects, *Erosion control, *Georgia, Reservoirs, Construction, Project feasibility, Ecology, Waste disposal, Long-term planning, Irrigation, Environmental control, Agricultural engineering, Administration, Recreation facilities, Project planning, Recreation, Soil conservation, Farm ponds, Wildlife conservation, Land management, Economics.
Identifiers: *Environmental impact statements.

The final statement approves of the project, aimed at soil conservation, irrigation and recreational water supply and use. To implement the treatment program, the project proposes to construct 12 reservoirs for irrigation supply and 1 multiple use reservoir for recreation and irrigation use. The poor hydrologic condition in the area, sub-region 6, South Atlantic Gulf Coast Water Resources Region, is due primarily to overgrazing, poor harvesting, frequent burning and cultivation of these rural lands. The recreational opportunities are very limited. To be compatible with the environment and sound watershed management, dams, spillways and barrow areas will be vegetated with grass and legumes immediately after construction of the reservoirs. The reservoirs should reduce erosion, lead to new farm ponds which will furnish additional surface areas for recreational use and will possibly lead to waterfowl stimulus. Wastes will be disposed of in accordance with Georgia's state solid waste management rules. No known practical alternatives are available and the project should produce minimal adverse environmental effects which are listed. Appendix A shows a benefit cost ratio of 2.2:1 and Appendix B gives comment and suggestion letters from various state and federal agencies. (Sutton-Florida)

Identifiers: Biological materials, *North Sea, Background levels, Biological samples, Atomic absorption spectrophotometry, Dissolved metals, Chemical concentration, Silver, Fucus vesiculosus, Porphyra umbilicalis, Patella vulgata.

The distribution of zinc, manganese, nickel, copper and cadmium in water and biological material has been measured in the southern North Sea and Straits of Dover, and off the north-east coast of England. Analyses were conducted by means of an atomic absorption technique. Zn, Mn, Cu, Ni, and Cd were measured in all samples. Fe was additionally analyzed in shoreline and biological samples; Pb and Ag were measured in the biological material only. With the exception of cadmium, the metals measured showed onshore-offshore gradients to varying degrees, the highest values generally occurring in the vicinity of estuaries. The concentration of cadmium varied between less than 0.1 and 1.4 micrograms/l but its distribution could not be contoured with any degree of confidence. These investigations provide values against which future pollution changes can be measured. (Holoman-Battelle)

TRACE METALS IN SEDIMENTS OF NEW YORK BIGHT,
Westchester Community Coll., Valhalla, N.Y. Dept. of Chemistry.
D. J. Carmody, J. B. Pearce, and W. E. Yasso.
Marine Pollution Bulletin, Vol 4, No 9, p 132-135, September 1973. 6 fig, 3 tab, 14 ref.

Descriptors: *Trace elements, *Bottom sediments, Chromium, Copper, Lead, Nickel, Zinc, *Waste disposal, *Heavy metals, Pollutant identification, Sewage sludge, Pollutants, Water pollution sources, Chemical analysis, Soil analysis, Aquatic soils, Solvent extractions, Methodology, Bottom sampling, *Spectrophotometry.

Identifiers: *New York Bight, Dredge spoils, Marine environment, Atomic absorption spectrophotometry.

Sediment samples from seventy-five stations around the waste disposal sites in the New York Bight were analyzed for the presence of Cr, Cu, Pb, Ni, and Zn. Twenty-five other sites in the Hudson Shelf Valley and in Delaware Bay were sampled for comparative purposes. A Smith-McIntyre bottom grab was used for sampling. Aliquots were removed, frozen, oven-dried at 105C, extracted in 8 N HN03 for 30 min, and filtered to a constant volume. The resulting solutions were analyzed by atomic absorption. There was a greater variation in heavy metal concentrations in and near the dumping areas than in the uncontaminated regions. In severely polluted areas, metal concentrations occasionally varied as much as 50 percent between subsamples taken from the same grab sample. On comparing metal concentrations at different depths to a depth of 15 cm, no consistent trend was discernible. (Holoman-Battelle)

MULTIELEMENT INSTRUMENTAL NEUTRON ACTIVATION ANALYSIS OF BIOLOGICAL TISSUE USING A SINGLE COMPARATOR STANDARD AND DATA PROCESSING BY COMPUTER,
Massachusetts General Hospital, Boston. Physics Research Lab.
D. M. Linekin.
International Journal of Applied Radiation and Isotopes, Vol 24, No 6, p 343-351, June 1973. 4 fig, 2 tab, 7 ref.

Descriptors: *Neutron activation analysis, *Heavy metals, *Irradiation, Bromine, Sodium, Mercury, Iron, Chromium, Zinc, Cobalt, Pollutant identification.
Identifiers: *Biological samples, *Sample preparation, Scintillation counting, Gold, Selenium, Antimony, Silver, Scandium, Blood, Lung, Liver, Heart, Kidney, Tumors, *Multielement analysis.

Equations were derived which show that multielement analysis can be carried out with a single comparator standard, cobalt, and thereby eliminate multiple runs. A computer technique employing a Fourier transform is employed for data smoothing. Biological samples, human blood, lung, liver, heart, kidney, and mouse tumors were analyzed for Au, Br, Na, Se, Cr, Cs, Ag, Pb, Sn, Zn, Hg, Sb, Sc, Co, and Fe. The samples were prepared by lyophilizing in polyethylene vials, sealing, wrapping the vials with cobalt-aluminum wire, and irradiating at 2 times 10 to the 13th power thermal neutrons/sq cm/sec for 9 hours. Five or six days after irradiation, samples were transferred to counting vials and counted for 100 min in a reproducible geometry 30 cm from a Ge(Li) detector. Concentrations of Au, Br, and Na were determined from these results. The remaining elements were analyzed by making counts for 1000 min. at 5 cm from the detector six weeks after irradiation. Two weeks after irradiation, the cobalt wires were cleansed, weighed, and counted in the integral mode in a NaI well counter. The method should be useful for other kinds of samples. (Little-Battelle)

DETERMINATION OF AMETRINE AND ATRAZINE RESIDUES IN SOIL BY THIN-LAYER CHROMATOGRAPHY,
Serbian Inst. of Public Health, Belgrade (Yugoslavia). Dept. of Sanitary Chemistry.
M. Huss, and V. M. Adamovic.
Journal of Chromatography, Vol 80, No 1, p 137-139, May 30, 1973. 1 tab, 9 ref.

Descriptors: *Separation techniques, Soil analysis, *Chromatography.
Identifiers: *Sample preparation, Thin layer chromatography, *Atrazine, *Ametrine, Detection limits, Recovery, Cleanup.

During a study of the degradation of atrazine and ametrine in soil a procedure for thin layer chromatography was developed. Soil samples were extracted by drying, grinding, shaking with ammonia solution and diethyl ether, filtering through sodium sulfate, evaporating, reconstituting with diethyl ether, evaporating to dryness, and dissolving the residue in chloroform. The dissolved residue was spotted on chromatoplate covered with alumina G to which Uramin A fluorescent color had been added. Near this spot, standard solutions of the pesticides were added, a carbon disulfide-ethyl acetate mixture was applied for separation, and the spots observed and marked under UV lights. These layers were scraped off and eluted with methanol in chloroform into tubes and evaporated. Determinations were made by rinsing the tubes with chloroform, partially evaporating, transferring the remainder to a silica gel chromatoplate, and developing the plate with carbon disulfide-ethyl acetate. The areas of the spots of the unknown compounds were compared with those of standards under UV light at 254 nm. Recovery of ametrine and atrazine was 80-83 percent and 100 percent, respectively. The procedure makes possible the detection of as little as 0.005 ppm triazine. Organochlorines do not interfere in the detection of triazines. (Little-Battelle)

DETECTION OF ORGANOPHOSPHOROUS PESTICIDES BY IN SITU FLUOROMETRY ON THIN-LAYER CHROMATOGRAMS,
Moncton Univ. (New-Brunswick). Dept. of Chemistry.
G. L. Brun, and V. Mallet.
Journal of Chromatography, Vol 80, No 1, p 117-123, May 30, 1973. 4 tab, 5 ref.

Descriptors: *Flurometry, *Organophosphorus pesticides, Fluorescence, *Chromatography, *Pollutant identification.
Identifiers: *Detection limits, Thin layer chromatography, Sample preparation, Azinphosmethyl, Bayrusil, Coumaphos, Cythioate, Dursban, Fospirate, Imidan, Maretin, Menazon, Noltran, Phosalone, Zinophos.

Solutions of 35 pesticides were prepared to study the effect of heat treatment alone or spraying the plate with an acid or base prior to heating on fluorescence during thin-layer chromatography. For chromatographic separation, the pesticides were spotted 2 cm from the bottom of the plate, eluted with m-hexane-acetone, dried, and when necessary sprayed with appropriate reagent. Plates were then heated at 50 to 250C for 10 to 120 minutes to establish optimum conditions for fluorescence. Twelve pesticides, azinphosmethyl, Bayrusil, coumaphos, cythioate, Dursban, Fospirate, Imidan, Maretin, menazon, Noltran, phosalone, and zinophos, gave positive results under various experimental conditions, and spectral data, experimental conditions, and detection limits (0.001-1.0 micrograms) are listed. The use of acid or base improved the limits of detection markedly in the case of Bayrusil, but in other cases there was either little improvement or a slight decrease in fluorescence. The importance of the acid- or base-treatment, however, was reflected more by the changes in the fluorescence excitation and emission maxima. In combining the spectral data on both techniques, a great deal more selectivity should be introduced in practice. Another advantage is that the use of acid or base does not have any effect whatsoever on the background of the plate. (Little-Battelle)

LIPOPOLYSACCHARIDE AND PROTEINS OF THE CELL ENVELOPE OF VIBRIO MARINUS, A MARINE BACTERIUM,
Georgetown Univ., Washington, D.C. Dept. of Biology.
C. F. Deneke, and R. R. Colwell.
Canadian Journal of Microbiology, Vol 19, No 10, p 1211-1217, October 1973. 5 fig, 2 tab, 33 ref.

Descriptors: *Proteins, *Cytological studies, Lipids, Phosphates, Acids, *Electrophoresis, *Marine bacteria, Centrifugation, Distillation, Hydrolysis, *Chromatography, Ureas, Pollutant identification, *Enteric bacteria.
Identifiers: *Vibrio marinus, *Lipopolysaccharides, Sugars, Fatty acids, Thin layer chromatography, Gas liquid chromatography, Flame ionization gas chromatography, Glucose, Heptose, Gel electrophoresis.

Lipopolysaccharides isolated from the marine bacterium Vibrio marinus strain PS-207 were found to be similar to the lipopolysaccharides of R mutants of enteric organisms, with respect to extraction characteristics, percentage of lipid A (61 percent), and sugars of the polysaccharide side chain (glucose and heptose). A high ratio (2:1) of phosphate to amino sugar was found in the lipid A. Hydroxy fatty acids constituted only 14 percent of the total fatty acids of the lipid A fraction, whereas branched and straight-chain fatty acids were present in greater abundance. The major envelope proteins of V. marinus strain PS-207 fell into three molecular weight classes determined by SDS gel electrophoresis. Numerous protein species were observed in urea-acetic polyacrylamide gel electrophoresis preparations. (Mortland-Battelle)

ARSENIC AND ANTIMONY IN LAUNDRY AIDS BY INSTRUMENTAL NEUTRON ACTIVATION ANALYSIS,
Food and Drug Administration, Washington, D.C. Div. of Chemistry and Physics.
J. T. Tanner, M. H. Friedman, and G. E. Holloway.
Analytica Chimica Acta, Vol 66, No 3, p 456-459, October 1973. 1 fig, 1 tab, 3 ref.

Descriptors: *Neutron activation analysis, *Chemical analysis, *Detergents, *Pollutant identification, Water pollution sources, Domestic wastes, Laundering, Heavy metals, X-ray fluorescence, Colorimetry.
Identifiers: *Arsenic, *Antimony, Instrumental neutron activation analysis.

Samples of laundry aids (3 enzyme presoaks, 1 detergent, 2 heavy-duty enzyme detergents and 1 heavy-duty detergent) and standards of As(III) oxide and metallic antimony were sealed in quartz and irradiated for 20 min and allowed to undergo radioactive decay for 3-5 days for determinations of As and Sb concentrations by neutron activation analysis. The analyses were made with a high-resolution Nuclear Diodes Ge(Li) detector and a Nuclear Data 4096 channel analyzer. The concentrations in the laundry aids tested ranged from 5 to 51 ppm of As and from 1 to 8 ppm of Sb. In comparison, values for arsenic as determined by X-ray fluorescence and colorimetry were, respectively, 6-47 ppm and 5.57 ppm. (Holoman-Battelle)

Identifiers: Marine environment, Card Sound(Fla), Biscayne Bay(Fla), Silver, *Bermuda Mangrove Lake, Vanadium, Sample preparation, Flameless atomic absorption spectrophotometry.

During an investigation of the trace transition metal distributions within carbonate and organic rich near-shore and estuarine sediments, three separate geographical locations, Card Sound and Turkey Point, Florida and Mangrove Lake, Bermuda, have been studied. The sediment samples were collected with hand coring tubes and homogenized. A subsample was freeze-dried to a constant weight and analyzed by flameless atom reservoir atomic absorption spectrophotometry after acid dissolution and solvent extraction of the metal pyrrolidine dithiocarbamates. The results obtained from the three areas show that the accumulations could be ascribed to local human activities, though their nature varied widely from one site or another. (Holoman-Battelle)

PESTICIDE RESIDUES IN NATURAL FISH POPULATIONS OF THE SMOKY HILL RIVER OF WESTERN KANSAS - 1967-69: 10H. E. KLAASSEN, AND
Kansas State Univ., Manhattan. Div. of Biology.
H. E. Klaassen and A. M. Kadoum.
Pesticides Monitoring Journal, Vol 7, No 1, p 59-64, June 1973. 2 fig, 4 tab, 14 ref.

Descriptors: *Fish populations, *Pesticide residues, *Chlorinated hydrocarbon pesticides, *Freshwater fish, Dieldrin, DDT, Baseline studies, Chemical analysis, Channel catfish, Carp, Killifishes, Electro-fishing, Sampling, Endrin, Aldrin, Heptachlor, White bass, *Kansas.
Identifiers: *Smoky Hill River(Kan), Metabolites, Background levels, Animal tissues, Sample preservation, Sample preparation, Electron capture gas chromatography, Heptachlor epoxide, River carpsucker, Shorthead, Red shiner, Plains killifish, Green sunfish, Gizzard, Heptachlor epoxide, o,p' DDT, p,p' DDT, p,p' DDE, p,p' DDD, Muscle, Testes, Ovaries, Bluegills, Gizzard shad, Plains minnow, Sand shiner, Suckermouth minnow, Bluntnose minnow, Flathead minnow, Creek chub, Black bullhead, Yellow bullhead, Stonecat.

Fish Population from five locations in an area of low pesticide use are described and their pesticide residue levels are given for the 3-year period 1967-69. The study was carried out in a dry-land farming area with developing irrigation on the Smoky Hill River of west central Kansas. Fish samples were collected by electro-shocking at five stations along an 80-km section of the river. A total of 398 samples of the commonly occurring species whole body, flesh, gonads) were analyzed for organochlorine residues by electron capture gas chromatography. During the 3 years, 24 species of fishes were collected. 15 of these species were common to the study area. The number of species, number of individuals collected, and species diversity are presented for each station with respect to time. No endrin, aldrin, or heptachlor residues were detected in any sample. Heptachlor epoxide was found in trace amounts in three samples. Dieldrin was present in 15 percent of the samples, usually in amounts less than 0.01 ppm. DDT and its metabolites were detected in 75 percent of the samples, usually at only several hundredths of a part per million. The fish populations collected were considered "clean" from pesticides when compared with fishes from other surveys. These data form a baseline for future comparison as the agriculture changes in this area. (Holoman-Battelle)

INTERNATIONAL COOPERATIVE STUDY OF ORGANOCHLORINE AND MERCURY RESIDUES IN WILDLIFE, 1969-71.
Freshwater Fisheries Lab., Pitlochry (Scotland).
A. V. Holden.
Pesticides Monitoring Journal, Vol 7, No 1, p 37-52, June 1973. 16 tab, 3 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Pesticide residues, *Mercury, *Heavy metals, *Polychlorinated biphenyls, *Wildlife, Shellfish, Freshwater fish, Waterbirds, Pollutants, Pollutant identification, Bird eggs, Insecticides, Chemical analysis.
Identifiers: Bioaccumulation, Animal tissues, Interlaboratory studies, Collaborative studies, Chlorinated hydrocarbons, Northern pike, Eggs, Lucius, Methylmercury, Methylmercury dicyandiamide, Precision, Muscle, Lindane, Heptachlor epoxide, p,p' DDE, p,p' TDE, p,p' DDT, o,p' DDT, Clophen A50, Roach, Cormorant, DCBP, Aroclor 1260, Clophen A50, Phenoclor DP6, Aroclor 1254, Rutilus rutilus, Anguilla vulgaris, Mytilus edulis, Clupea harengu, Clupea Sprattus, Sprat, Ardea, Pelecanus, Podiceps, Uria, Alca, Sterna.

A two-part collaborative study of organochlorine pesticides, polychlorinated biphenyls (PCB's), and mercury residues was carried out by 26 laboratories in 12 countries. The first part involved the analysis of three test samples containing organochlorine residues and one group of test samples containing mercury. One organochlorine sample contained seven pesticides or derivatives added to corn oil; a second was a standard solution of a PCB formulation in toluene; and the third a homogenate of cormorant (Phalacrocorax carbo) muscle containing mainly PCB's. With few exceptions, agreement among the analysts involved was reasonably good and acceptable for monitoring wildlife residues. Coefficients of variation for the various organochlorines were from plus or minus 10 percent to plus or minus 7 percent. The test samples containing mercury included a group of freeze-dried homogenates of the muscle tissue of pike, liver tissue, and an ampoule of methylmercury dicyandiamide in water. The samples were analyzed for total and methylmercury. Again, agreement was reasonably good, although only four laboratories reported total mercury values and eight, methylmercury values. The second part of the program required the sampling and analysis of several species of wildlife from both terrestrial and aquatic environments, including fish, shellfish, and the eggs of birds. Samples were taken in specified numbers and at specified times, from both areas considered to be free of any pesticide usage and areas known or believed to be seriously polluted. Eggshell thickness indices were also determined. The results of the wildlife analyses demonstrated the difficulties in selecting species appropriate for international monitoring programs, in identifying (before analysis) areas of slight contamination, and in relating concentrations to measurable biological effects. Samples of any one species from areas regarded as unpolluted in different countries contained a wide range of organochlorine concentrations. The PCB levels in mussels from such areas contained 0.01 to 0.67 mg/kg, and DDE levels in herring ranged from less than 0.01 to 0.05 mg/kg. The differences between results for samples in this second part of the study were much greater than the analytical variations estimated from the first part of the study. (Holoman-Battelle)

INABILITY TO DETECT SPORES OF CLOSTRIDIUM BOTULINUM IN FISH PROTEIN CONCENTRATES (FPC).
Department of National Health and Welfare, Ottawa (Ontario). Food and Drug Research Lab.
A. H. W. Hauschild, H. Pivnick, and L. W. Regier.
Journal of the Fisheries Research Board of Canada, Vol 30, No 11, p 1760-1762, November 1973. 1 tab, 8 ref.

Descriptors: *Botulism, Proteins, Spores, Cultures, Lethal limit, Toxicity, Separation techniques, *Pollutant identification.
Identifiers: *Fish protein concentrate, *Clostridium botulinum, Mice, Sample preparation, *Detection limits.

Samples of fish protein concentrates from a total of 124 production lots prepared in pilot plants by three different methods have been tested for the presence of viable Clostridium botulinum spores by incubating them in cooked meat medium and assaying the culture supernatant fluids for toxin. The samples were divided into three groups. The 36 lots of group A were prepared by a hot isopropanol extraction method from skate, dogfish, cod frames and fillets, flounder, ocean perch, sand lance, swordfish, herring, capelin, and haddock frames. The 60 lots of group B were prepared from cod fillets by a more gentle procedure (unpublished, patent pending) which includes dispersion of the meat in water, centrifuging, resuspension of the sediment in dilute brine, pH adjustment to 8.5, holding, adjusting to pH 4.5, heating and cooling, adjusting to pH 6.5, centrifuging, three repeated lipid extractions of the sedi-

ment with isopropanol at ambient temperature, drying in a rotating cone vacuum drier at 70-75C, and grinding in a Hammer mill. The 24 lots of group C were prepared by hot isopropanol extraction of hake, menhaden, and anchovy. No spores of C. botulinum could be demonstrated with certainty in any of the 124 samples of FPC tested. Two of the supernatant fluids were lethal to mice, but their lethal effects appeared to be caused by factors other than C. botulinum toxin. (Mortland-Battelle)

OCCURRENCE OF DDT RESIDUES IN BELUGA WHALES (DELPHINAPTERUS LEUCAS) FROM THE MACKENZIE DELTA, N.W.T.,
Bedford Inst., Dartmouth (Nova Scotia).
R. F. Addison, and P. F. Brodie.
Journal of the Fisheries Research Board of Canada, Vol 130, No 11, p 1733-1736, November 1973. 1 tab, 16 ref.

Descriptors: *Marine animals, *Pesticide residues, *Pollutant identification, *DDT, Chlorinated hydrocarbon pesticides, Mammals, Chemical analysis, Lipids, Pollutants, *Canada.
Identifiers: *Beluga whales, Animal tissues, Delphinaterus leucas, p p' DDE, p p' DDT, o p' DDT, Isomers, Blubber, Muscle, Liver, Gas liquid chromatography, Sample preparation, Shallow Bay, Kugmallit Bay, p p' DDD.

Tissue samples from 14 Beluga whales were analyzed for the presence of pesticide residues as a possible reflection of the level of pesticide contamination of the marine environment in the Mackenzie Delta area. Blubber, middorsal muscle, and liver samples were taken and preserved in formalin or frozen. Ten grams were dissected from the interior of each sample, extracted by homogenizing with an acetonitrile-based system, evaporated to dryness for gravimetric lipid determination. Additional aliquots were cleaned up by chromatography on Florisil and analyzed by gas-liquid chromatography. Only residues of the DDT group were detected with certainty. Muscle and liver contained p,p'-DDE and p,p'-DDT; total residue concentrations in these tissues were approximately 0.01 and 0.02 ppm fresh weight, respectively. Blubber contained p,p'-DDE, p,p'-DDT and o,p'DDT; total residue content was approximately 2-4 ppm fresh weight. (Holoman-Battelle)

PESTICIDES IN SELECTED WESTERN STREAMS - 1968-71,
Geological Survey, Austin, Tex. Water Resources Div.
J. A Schulze, D. B. Manigold, and F. L. Andrews.
Pesticides Monitoring Journal, Vol 7, No 1, p 73-84, June 1973. 3 fig, 3 tab, 9 ref.

Descriptors: Natural streams, *Chlorinated hydrocarbon pesticides, *Phosphothioate pesticides, *Monitoring, *Polychlorinated biphenyls, Pollutant identification, Insecticides, Herbicides, Water analysis, Gas chromatography, Water sampling, Solvent extractions, *Data collections, Diazinon, Organophosphorus pesticides, Heptachlor, DDT, 2 4 5-T, Missouri River, Rio Grande River, Colorado River, Columbia River, 2 4-D, Dieldrin, DDD, DDE, Endrin, Aldrin.
Identifiers: Sample preparation, Heptachlor epoxide, Parathion, Methyl parathion, Malathion, Lindane, Silvex, Endosulfan, Chlordane, Toxaphene, Electron capture gas chromatography, Flame photometric gas chromatography, Yellowstone River, James River, Platte River, Arkansas River, Canadian River, Brazos River, Pecos River, Green River, Gila River, Humboldt River, Sacramento River, Yakima River, Snake River, Feather River.

Data are presented from the U.S. Geological Survey program for monitoring pesticides in the streams of the Western United States for the period October 1968 to September 1971. Samples were collected in 1-quart glass bottles sealed with a Teflon-lined screw cap. Two bottles were collected at each of 20 sampling stations, one for insecticide analysis and the other for herbicide analysis. All analyses were performed by gas chromatography. Compounds determined include the common chlorinated insecticides and herbicides. Heptachlor and its epoxide were not detected during the 3-year period, and aldrin was found only once. DDT was the most frequently occurring insecticide, and 2,4,5-T the most common herbicide. The amounts observed were small; the maximum concentration of an insecticide was 0.46 microgram/liter for DDT, and of an herbicide 0.99 microgram/liter for 2,4-D. Concentrations were highest in water samples containing appreciable amounts of suspended sediments. Graphs are included to show insecticide and herbicide occurrences for the 4-year period (October 1967-September 1971) during which all 20 monitoring stations have been in operation. Beginning in July 1970, the phosphorothioate insecticides - parathion, methyl parathion, malathion, and diazinon - were determined monthly on all samples. Malathion was not found during this period. Polychlorinated biphenyl (PCB's) compounds which were monitored for beginning in October 1969 were also detected at two stations. (Holoman-Battelle)

TRACE METAL WATER POLLUTANTS DETERMINED BY X-RAY FLUORESCENCE,
Naval Research Lab., Washington, D.C.
P. G. Burkhalter.
Available from the National Technical Information Service as AD-766 453 $2.75 in paper copy $1.45 in microfiche. Report No. NRL-7637, August 7, 1973. 15 p, 7 fig, 6 tab, 12 ref, append.

Descriptors: *X-ray fluorescence, *Sewage sludge, *Trace elements, *Water analysis, *Pollutant identification, Manganese, Iron, Zinc, Lead, Copper, Cadmium, Potassium, Titanium, Strontium, Heavy metals, Cation exchange, Ions, Sewage effluents, Filters, Separation techniques, Alkaline earth metals.
Identifiers: Arsenic, Selenium, Zirconium, Sample preparation.

X-ray fluorescence analysis was evaluated for determining trace metals in samples of Potomac River water and Blue Plains sewage sludge. A specimen of Potomac River water was filtered through 0.8-micron Millipore filters to collect the particulates. The water, now clear, was acidified with HCl to a pH of about 2, and was passed seven times through a Reeve Angel SA-2 cation exchange paper to collect the dissolved ions. The ions from an EPA multi-element solution with known amounts of the elements were collected on ion-exchange paper in a similar fashion for comparison. Samples of sewage sludge were filtered onto the millipore paper without difficulty. X-ray spectra were collected for 100 seconds for each of the samples. XRF analysis was found useful for multi-element determinations of trace metals in polluted waters. Both particulates and soluble trace metals in river water and sewage sludge can easily be sampled on filter papers which are convenient for use in x-ray equipment. The detectable limits for many pollutants with atomic numbers ranging from Ca to Pb are in the 1-10 ppb range for particulates filtered from river water and in the 5-15 ppb range for soluble trace metals extracted by ion-exchange papers. However more work is necessary to study the use of ion exchange papers and interferences in actual multi-element samples and to establish the best conditions for XRF of water pollution samples. SOLVENT EXTRACTION OF COPPER (II) AND ZINC (II) WITH 1,5-DIPHENYLCARBAZONE,
National Inst. for Researches in Inorganic Materials, Ibaraki (Japan).
H. Einaga, and H. Ishii.
Analyst, Vol 98, No 1172, p 802-810, November 1973. 5 fig, 2 tab, 10 ref.

Descriptors: *Copper, *Zinc, *Solvent extractions, *Ions, Separation techniques, Aqueous solutions, Spectrophotometry, Absorption, Hydrogen ion concentration, Mathematical studies, Water analysis, *Heavy metals, Pollutant identification.
Identifiers: 1 5-Diphenylcarbazone, Isobutyl methyl ketone, Ligands, Molar absorptivity, Organic solvents.

The extraction characteristics of 1, 5-diphenylcarbazone and its complexes with the bivalent metal ions copper(II) and zinc(II) in an isobutyl methyl ketone-water system have been studied and the extraction curves of these metal complexes have also been obtained. The copper(II) complex is extracted from a more acidic solution than is the zinc(II) complex. A mixture of N ml of the 1, 5-diphenylcarbazone solution and (20.0-n) ml of isobutyl methyl ketone was equilibrated at various pH values with 20.0 ml of an aqueous solution that contained a definite amount of metal ions and was adjusted to an ionic strength of 0.10 M with ammonium chloride. After separation of the phases, the metal ions extracted into the organic phase were determined by measuring absorbances at a specified wavelength and by making use of the molar absorptivity of each metal ion. The separation aqueous phase was used for measurement of hydrogen-ion concentration. The concentration of metal ions in the aqueous phase was obtained as the difference between the initial concentration and that in the organic phase, and the ratio of the concentration of the metal ions in the organic phase to that in the aqueous phase was calculated from these results. The extraction equilibria were examined and the extraction constants determined. The spectral properties of the complexes were also determined and the application of the reagent to the determination of copper and zinc is suggested. (Mortland-Battelle)

A SOLVENT-SAVING EXTRACTION-EVAPORATION APPARATUS DEVELOPED FOR RESIDUE ANALYSIS OF PESTICIDES,
CIBA-GEIGY Ltd., Basel (Switzerland).
G. Voss, and W. Blass.
Analyst, Vol 98, No 1172, p 811-812, November 1973. 1 fig, 1 tab, 1 ref.

Descriptors: *Pesticide residues, *Separation techniques, DDT, Gas chromatography, Laboratory equipment, Solvents, Soil analysis, *Solvent extractions, *Pollutant identification.
Identifiers: *Soxhlet extraction, Atrazine, Chlorobenzilate, Dichlorvos, Methidathion, Cleanup, Monocrotophos, Gas liquid chromatography, Column chromatography, Thin layer chromatography, Preconcentration, Biological samples, Chemical Recovery.

An apparatus that simultaneously allows Soxhlet extraction of pesticedes and concentration of the resulting extract has been designed. The evaporated solvent is refluxed into the Soxhlet

flask where it is utilized again for the extraction. The major advantages of this cyclic extraction-evaporation system are that redistillation of solvents prior to extraction can be omitted, that manual work is reduced, as the solvent evaporation process occurs simultaneously with the extraction of the sample, and that excess of solvent is not wasted but re-utilized for extraction, which is of interest from the economic and environmental contamination points of view. The procedure was tested with loam spiked with atrazine, apples spiked with chlorobenzilate, meat spiked with DDT, wheat spiked with dichlorvos, orange peel spiked with methidathion, and cotton seeds spiked with monocrotophos. Recoveries ranged from 74-110 percent. (Mortland-Battelle)

COLIFORM COUNTS OF POLLUTED WATERS: A COMPARISON OF MEDIA AND METHODS,
Nairobi Univ. (Kenya). Dept. of Civil Engineering.
D. D. Mara.
Water Research, Vol 7, No 12, p 1899-1903, December 1973. 1 fig, 3 tab, 8 ref.

Descriptors: *Pollutant identification, *Isolation, *Coliforms, *Methodology, E. coli, Sewage, Membrane processes, Fermentation, Cultures.
Identifiers: *Enumeration, *Culture media, Membrane filters, Enterobacter aerogenes, Culturing techniques, Kenya, Most probable number test.

Samples of sewage and polluted river water were used to compare various media for the enumeration of coliform organisms, including Escherichia coli, by the membrane filtration, pour-plate and MPN techniques. The counts were done using the standard procedures for each technique. Incubation times and temperatures for the MPN and membrane filtration media were those recommended (Report, 1969; A.P.H.A., 1971); those for the pour-plate media were 4 h at 30 C (or, in the case of chlorinated samples, 6 h at 25 C) followed by 18-20 h at either 35 or 44 C. Millipore membrane filters were used. In the pour-plate experiments surface growth was prevented by pouring a thin overlay of medium as soon as the original medium had set; after incubation only colonies larger than 2 mm were counted. The results indicated that the pour-plate technique with LTA (lactose teepol agar) is a reliable alternative to membrane filtration and the MPN technique. It is, of course, suitable only for coliform densities greater than 3000/100 ml, but for such densities it is the method of choice since it is more economic, both in terms of time and materials than the other two methods. It is, however, less convenient to use than the agar dip-slide method which gives counts to the nearest order of magnitude in the range 10,000-1 billion cells/100 ml. (Mortland-Battelle)

OCCURRENCE OF PHOSPHONOSPHINGOLIPIDS IN BDELLOVIBRIO BACTERIOVORUS STRAIN UKI2,
Kentucky Univ., Lexington. School of Biological Sciences.
S. Steiner, S. F. Conti, and R. L. Lester.
Journal of Bacteriology, Vol 116, No 3, p 1199-1211, December 1973. 6 fig, 10 tab, 31 ref.

Descriptors: *Chemical analysis, Separation techniques, Radioactivity techniques, Methodology, *Pollutant identification, Lipids, Organic acids, *Chromatography.
Identifiers: Chemical composition, *Phospholipids, *Bdellovibrio bacteriovorus, Characterization, Phosphonosphingolipids, Sample preparation, Biosynthesis, Heterotrophic bacteria, Phosphatidylethanolamine, Phosphatidylglycerol, Flame ionization gas chromatography, Paper chromatography, Autoradiography, Column chromatography, Thin layer chromatography, Phosphatidic acid, Phosphatidylserine, Cardiolipin, Fatty acids.

The major phospholipids of two strains of Bdellovibrio bacteriovorus were characterized. Both strain UKil, which is obligately saprophytic, and strain UKi2 which is facultatively parasitic, contained phosphatidylethanolamine and phosphatidylglycerol as their major glycerophosphatides. A branched, 15-carbon fatty acid is the major component of these alkali-labile lipids. Absent from UKi1 but present in UKi2 were three alkali-stable lipids (compounds 8,9, and 11) which appear to be phosphosphingolipids. After acid hydrolysis, both compound 8 and 9 yield the identical phosphorus-containing substance that is water soluble, dipolar ionic, and ninhydrin positive. The substance appears to contain a C-P bond since P sub 1 could not be released from this substance by treatment with alkaline phosphatase or by very harsh mineral acid treatment. Based on chromatographic comparisons, this phosphonate appears to be a novel lipid constituent. Upon degradation, compound 8 yields 1 mol of dihydroxy long-chain base and compound 9 yields 1 mol of a trihydroxy long-chain base. These bases appear to have a 17-carbon, possibly branched, structure based on gas-liquid chromatography retention times. Degradation of both sphingolipids yields a mixture of hydroxy fatty acids, the major component being a branched, 15-carbon hydroxy acid. (Holoman-Battelle)

DEFECTS IN PRODIGIOSIN FORMATION BY L-FORMS OF SERRATIA MARCESCENS,
Veterans Administration Hospital-Wadsworth, Los Angeles, Calif. Research and Medical Service.
C. S. Potter, E. G. Hubert, J. Z. Montgomerie, G. M. Kalmanson, and L. B. Guze.
Journal of Bacteriology, Vol 116, No 3, p 1343-1345, December 1973. 2 tab, 6 ref.

Descriptors: *Pigments, *Separation techniques, *Aerobic bacteria, Cultures, Methodology, Chemical analysis, Assay.
Identifiers: *Mutants, *Serratia marcescens, *Prodigiosin, Heterotrophic bacteria, Culture media, 4-Methoxy-2 2'-bipyrrole-5-carboxaldehyde, 2-Methyl-3-n-amylpyrrole.

An L-form of Serratia marcescens has previously been shown incapable of producing the red pigment, prodigiosin, characteristic of the parent bacteria. Mutants of S. marcesens, unable to form one or the other of the two prodigiosin precursors, 4-methoxy-2,2'-bipyrrole-5-carboxaldehyde or 2-methyl-3-n-amylpyrrole, were used to test the nature of the L-form defect. The L-forms failed to form sufficient amounts of either precursor to be detected by the appropriate mutant, and, when furnished the precursors, failed to couple them to form prodigiosin. STUDIES WITH DITHIZONE. PART XXX. COMPLEXES OF METALS, WITH S-METHYLDITHIZONE AND THE METHYLATION OF METAL DITHIZONATES,
Leeds Univ. (England). Dept. of Inorganic and Structural Chemistry.
H. M. N. H. Irving, A. H. Nabilsi, and S. S. Sahota.
Analytica Chimica Acta, Vol 67, No 1, p 135-144, November 1973. 3 fig, 1 tab, 14 ref.

Descriptors: *Chlorides, *Ions, *Nitrates, *Heavy metals, Copper, Mercury, Nickel, Cobalt, Manganese, Zinc, Sulfur, Absorption, Chemical reactions, Chelation.
Identifiers: *Methyldithizone, *Methylation, *Acetates, *Metal chelates, Palladium, Phenylmercury, Dithizone, Methyl iodide, Nickel dithizonate, Sodium acetate, Palladium dithizonate, Bipyridyl, Chemical interference, Rare earth elements.

S-Methylidithizone (5-methylmercapto-1,5-diphenylformazan) reacts with the chlorides of copper(II), mercury(II) and phenylmercury(II) to give the 1:1 chelates (CuCl(MeDx), HgCl(MeDz) and C6H5Hg(MeDz)) and with nickel(II) and palladium(II) to give the 1:2 chelates, M(MeDz)2. All these complexes are intensely coloured in chloroform solution. No complexes are formed from cobalt(II), manganese(II) or zinc(II) or from the nitrates or acetates of copper and mercuy. Coordination increases the reactivity of the sulphur atom in dithizone. Whereas dithizone is unaffected by methyl iodide, nickel dithizonate, Ni(HDz)2, gives Ni(MeDz)2 when heated with methyl iodide in ethanol in the presence of sodium acetate; palladium dithizonate behaves similarly. The 1:1 adduct of nickel dithizonate with 2,2'-bipyrdyl gave only Ni(MeDz)2 on treatment with methyl iodide, and this complex would not form an adduct with bipyridyl. On standing in the light, Ni(MeDz)2 reacted photochemically to give the yellow isomer of S-methyl-dithizone. (Mortland-Battelle)

DISTRIBUTION OF DIELDRIN IN THE TURTLE,
Louisiana State Univ., New Orleans. Dept. of Pharmacology.
J. E. Pearson, K. Tinsley, and T. Hernandez.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 6, p 360-364, December 1973. 1 fig, 1 tab, 12 ref.

Descriptors: *Dieldrin, *Turtles, *Absorption, *Chemical analysis, *Pollutant identification, Gas chromatography, Separation techniques.
Identifiers: Animal tissues, *Bioaccumulation, Biological samples, Blood, Muscle, Brain, Kidneys, Liver, Electron capture gas chromatography, Adipose tissue, Sample preparation, Sample preservation.

A number of turles weighing 300 grams to one kilogram were injected with 20 mg/kg of dieldrin in a one-to-one solution of diethyl ether and corn oil (50 mg/kg). Groups were sacrificed at intervals for tissue analysis. At timed intervals after the intraperitoneal injection of dieldrin (20 mg/kg), the turtles were placed on a turtle board and with a hack-saw the ventral carapace was sawed off. The soft tissues were carefully dissected from the carapace to minimize bleeding. A blood sample was obtained from the heart and was kept chilled until centrifuged to separate the plasma. Sections of liver, kidney, muscle, and brain were obtained and quick frozen until analyzed. A sample of brown fat was dissected from the subcutaneous area of the perineal region. The concentration of dieldrin in the plasma and tissues was estimated by gas chromatography. The rate of absorption of dieldrin in the turtle after intraperitoneal injection was slow and unpredictable. The results at any single time were variable due to the erratic absorption from the intraperitoneal site. The fat depots gradually increased until the concentration of dieldrin approached 1000 ppm or 0.1 percent of the weight of the fat. Next to the fat, the liver has the greatest propensity to concentrate dieldrin. (Mortland-Battelle)

HERBICIDE ANALYSIS BY PULSE POLAROGRAPHY-FICLORAM,
Northern Arizona Univ., Flagstaff. Dept. of Chemistry.
D. D. Gilber, and J. M. Mann.
International Journal of Environmental Analytical Chemistry, Vol 2, No 3, p 221- 228, February 1973. 3 fig, 2 tab, 19 ref.

Descriptors: *Chemical analysis, *Herbicides, *Chlorinated hydrocarbon pesticides, Heavy metals, Aqueous solutions, Cations, Electrochemistry, Pollutant identification, *Polarographic analysis, Hydrogen ion concentration, Temperature, Water analysis, Methodology.
Identifiers: Pulse polarography, *Picloram, Ionic interference, Precision, Natural waters, Ionic strength, Detection limits, Buffers, Sensitivity.

The herbicide picloram, 4-amino-3,5,6-trichloropicolinic acid, can be determined at 0.02 ppm, without concentration, by pulse polarography. The effects of pH, ionic strength, and buffer constituents on the catalytic hydrogen process have been studied to optimize conditions for highest sensitivity for picloram. A buffer solution 0.01 M sodium acetate - 0.026 M acetic acid was used to evaluate the analysis of a natural water system. Errors range from 3-8 percent (relative) in the 0.05-0.20 ppm picloram range with precisions of plus or minus 5 percent (relative) or better. Interferences with 0.1 ppm picloram from 100 ppm Cr(VI) and Zn(II) are severe; neither ion interferes at 1 ppm. Fe(III) interferences can be eliminated by masking with EDTA. Mn(II), Cu(II), and Pb(II) do not interfere at 10 ppm. The results describe a method which is 4-5 times more sensitive than other reported polarographic methods and is more rapid than the conventional bioassay or gas chromatographic techniques. In addition, the pulse method is about 10 times more sensitive than the colorimetric analysis and can be conducted in a normally lighted laboratory. (Holoman-Battelle)

DETERMINATION OF RESIDUES OF MESUROL AND ITS TOXIC METABOLITES IN PLANT AND ANIMAL TISSUES,
Baychem Corp., Kansas City, Mo. Chemagro Div.
J. S. Thornton, and G. Drager.
International Journal of Environmental Analytical Chemistry, Vol 2, No 3, p 229-239, February 1973. 2 fig, 1 tab, 19 ref.

Descriptors: *Pesticide residues, *Plant tissues, *Chemical analysis, *Thiocarbamate pesticides, Pollutant identification, Cattle, Methodology, Crops, Solvent extractions, Apples, Corn(Field), Sugar beets, Fruit crops, *Gas chromatography.
Identifiers: *Mesurol, *Metabolites, Animal tissues, Flame photometric gas chromatography, Chemical recovery, Sample preparation, Mesurol sulfoxide, Mesurol sulfone, Pears, Brain, Adipose tissue, Heart, Kidneys, Liver, Muscle.

A specific gas chromatographic procedure is described for the determination of residues of Mesurol (4-(methylthio)-3,5-xylyl methylcarbamate) and its sulfoxide and sulfone metabolites in plant and animal tissues. After initial extraction and precipitation cleanup steps, the extract is oxidized with potassium permanganate to convert Mesurol and its sulfoxide to the sulfone. Final detection of the sulfone is by the sulfur-specific flame photometric detector, thereby allowing little interference from tissue co-extractives. Recovery data from experiments run on a large variety of crops and tissues by adding known amounts of Mesurol and metabolites at the blending step were generally in the 70 to 120 percent range. The method is sensitive to the 0.03-ppm level. (Holoman-Battelle)

Identifiers: Cleanup, *Phthalates, *Biological samples, Animal tissues, Environmental samples, Fish oil, Blubber, Corn oil, Dibutyl phthalate, *Plasticizers, Di-2-ethylhexyl phthalate, Seals(Animals), Salmo salar, Phoca vitulina, Phalacrocorax auritus, Larus argentatus, Flame ionization gas chromatography, Alumina chromatography, Thin layer chromatography, Dioctyl phthalate, Column chromatography, Diamyl phthalate, Diisodecyl phthalate, Diethyl phthalate, Dimethyl phthalate, Dimethyl terephthalate.

A cleanup of biological samples is described for the determination of phthalates. It can be incorporated into a cleanup-chromatography procedure used for the determination of chlorinated hydrocarbons. Phthalates, extracted from biological samples with hexane, are partially separated from lipids by chromatography on alumina to yield fractions in which the common phthalate plasticizers can be quantitated by gas chromatography. An additional cleanup is achieved by the extraction of phthalates from hexane into dimethyl formamide. Phthalates can then be confirmed by measurement of fluorescence in concentrated sulfuric acid. Analyses of spiked samples are reported Dibutyl phthalate was detected in eggs of double-crested cormorants (Phalacrocorax auritus) and herring gulls (Larus argentatus) in levels from 11 to 10 mcg/g lipid. Di-2-ethylhexyl phthalate was detected in hatchery-reared juvenile Atlantic salmon (Salmo salar) at 13-16 mcg/g lipid, and in the blubber of a common seal pup (Phoca vitulina) at 11 mcg/g lipid. A procedure using gas-liquid chromatography has been devised for the simultaneous analysis of a range of pesticides in the River Aire. It was essential to incorporate a clean-up system because the river is so heavily polluted. In the cleanup procedure, the extract was partitioned with dimethyl formanide saturated with hexane, reduced in volume with clean air, passed through an alumina column, eluted with hexane, and spotted on thin layer plates or injected on to a gas chromatograph. The thin-layer chromatographic identifications were used to confirm the information obtained by gas-liquid chromatography. Spiked samples of river water and effluent were analyzed by GLC and the recoveries were calculated. For most of the pesticides, recovery was greater than 85 per cent. The unspiked samples showed that alpha-BHC, gamma-BHC and dieldrin were usually present. Malathion, DDT, and DDE were detected occasionally. It is suggested that the pesticides originate in wool-scouring mills, the mill effluents entering the river via the Bradford Corporation Sewage Works. (Holoman-Battelle)

CHEMILUMINESCENCE ANALYSIS FOR TRACE POLLUTANTS,
Environmental Protection Agency, Athens, Ga. Southeast Water Lab.
W. R. Seitz, and D. M. Hercules.
International Journal of Environmental Analytical Chemistry, Vol 2, No 4, p 273-290, 1973. 10 fig, 6 tab, 30 ref.

Descriptors: *Pollutant identification, Methodology, *Trace elements, *Chemical reactions, Chemical analysis, Iron, Chromium, Catalysts, Hydrogen ion concentration, Chelation, Flow

rates, Pollutants, Heavy metals, Volumetric analysis, Nickel, Cobalt, Manganese, Copper, Ion exchange, Separation techniques, Oxygen, Bromine, Iodine, Cations, Anions.
Identifiers: *Trace levels, *Chemiluminescence, Luminol, Sensitivity, Detection limits, Vanadium, Complexation, Hypochlorite, Permanganate.

The sensitivity of luminol chemiluminescence to small catalyst concentrations can be exploited for environmental analysis in several ways. Selective methods for Cr(III) and Fe(II) in complex solutions have been applied to natural samples. The detection limits are 0.03 mcg/l and 0.005 mcg/l, respectively. Species that do not catalyze luminol chemiluminescence can be determined by titration with reagents that catalyze the reaction. For example, arsenic and aqueous sulfur dioxide can be titrated with iodine, an efficient catalyst. MnO4(-), OCl(-), V(II), and Cr(II) are other catalysts that can be used as titrants. Preliminary ion exchange separation in concentrated LiCl solutions extends chemiluminescence to other catalysts of the luminol reaction: Ni(II), Co(II), Mn(II), Cu(II), and V(IV). (Holoman-Battelle)

THE DETERMINATION OF TRACE TRANSITION ELEMENTS IN BIOLOGICAL TISSUES USING FLAMELESS ATOM RESERVOIR ATOMIC ABSORPTION,
Rosenstiel School of Marine and Atmospheric Sciences, Miami, Fla.
D. A. Segar, and J. L. Gilio.
International Journal of Environmental Analytical Chemistry, Vol 2, No 4, pp 291-301, 1973. 5 tab, 26 ref.

Descriptors: *Spectrophotometry, *Trace elements, *Chemical analysis, *Pollutant identification, *Plant tissues, Methodology, Marine animals, Marine plants, Heavy metals, Cadmium, Cobalt, Copper, Iron, Manganese, Nickel, Lead, Zinc, Marine algae, Invertebrates, Grasses, Solvent extractions.
Identifiers: *Animal tissues, *Heated graphite atomizer, Flameless atomic absorption spectrophotometry, Sample preparation, Biological samples, Vanadium, Silver, Orchard leaves, Sponges, Thalassia testudinum, Laurencia poitei, Penicillus capitatus, Chondrilla mucula, Haliclona molitba.

The development of an analytical technique generally applicable to the determination of Ag, Cd, Co, Cu, Fe, Mn, Ni, Pb, V, and Zn in all biological tissues is described. All of these elements may readily be determined in tissue samples of less than 0.5 g using flameless atom reservoir atomic absorption with a Perkin-Elmer heated graphite atomizer. Some of the operational characteristics of this atomizer system are discussed. The utility of the method is illustrated by analyses of selected marine biota and of NBS standard orchard leaves. AUTOMATION OF DIRECT POTENTIOMETRY,
Department of the Environment, Burlington (Ontario). Centre for Inland Waters.
I. Sekerka, and J. Lechner.
International Journal of Environmental Analytical Chemistry, Vol 2, No 4, p 313-322, 1973. 2 fig, 6 tab, 15 ref.

Descriptors: *Automation, Methodology, *Electrochemistry, Automatic control, Ammonia, Fluorides, Water analysis, Adsorption.
Identifiers: *Potentiometry, *Ion selective electrodes, Glass electrodes, Sampling rate, Ammonium, Chemical recovery, Chemical concentration, Precision.

A simple, versatile, automated direct potentiometry is described. It offers a wide range of possible applications for all types of ion-selective electrodes, including the glass electrode. The apparatus consists of two Fisher turntable sample changers connected to an Orion automatic switch, Orion pH/mV meter, and Orion printer system via a control module. The optimum sampling rate is 20 samples per hour F(minus) and NH(plus) in water samples as determined by using commercially available ion-selective electrodes. (Holoman-Battelle)

A SELECTIVE MICROSCALE X-RAY FLUORESCENCE ANALYZING METHOD FOR DETERMINATION OF TRACE ELEMENTS,
Jyvaskyla Univ. (Finland). Dept. of Physics.
P. Puumalainen, P. Suominen, J. Hattula, and H. Kalm.
International Journal of Applied Radiation and Isotopes, Vol 24, No 11, p 617-620, November 1973. 4 fig, 7 ref.

Descriptors: *Methodology, *X-ray fluorescence, *Trace elements, *Pollutant identification, Organic wastes, Selectivity, Heavy metals, Organic compounds, Irradiation, Chemical analysis.
Identifiers: *Trace levels, Accuracy, Sample preparation.

A new selective X-ray fluorescence analyzing method for trace element determination has been developed. In this method each trace element is measured independently. The excitation source is an X-ray tube that has a changeable anode and a variable high voltage. The exciting radiation is shaped with critical absorbers. The sample is viewed at backward angles through an absorber to reduce backscattered radiation. The estimated accuracy of this method is of the order of 10 percent in the sub-ppm range of trace element concentration in organic samples. Measurement times are of the order of a few minutes. (Holoman-Battelle)
W74-06135

IDENTIFICATION OF SUBSTANCES IN PETROLEUM CAUSING OBJECTIONABLE ODOUR IN FISH,
Okayama Univ. (Japan). Dept. of Public Hygiene.
M. Ogata, and Y. Miyake.
Water Research, Vol 7, No 10, p 1493-1504, October 1973. 11 fig, 4 tab, 9 ref.

Descriptors: *Pollutant identification, Marine fish, *Mass spectrometry, *Isolation, *Oil pollution, Sea water, Industrial wastes, Chemical analysis, Odor, Oil industry, Organic compounds, Eels, *Gas chromatography, Water pollution, *Spectrophotometry.
Identifiers: *Odor-producting substances, Petroleum hydrocarbons, Ultraviolet absorption spectrophotometry, Infrared absorption spectrophotometry, Flame ionization gas chromatography, Aromatic hydrocarbons, Aliphatic hydrocarbons, Animal tissues, Sample preparation, Toluene, Gasoline, Benzene, o-Xylene, m-Xylene, p-Xylene, Infrared absorption spectra, Ultraviolet absorption spectra, Mass spectra, Muscle, Liver.

In order to identify substances causing an offensive-odour in fish from the sea facing petroleum and petrochemical industries, analyses have been made on seawater, industrial waters, fish and eels kept in the sea or industrial waste for a certain period, by means of gas chromatography, i.r., u.v. absorption and mass spectrometry. Observations revealed toluene as a possible main cause of the odour. Finally, by analysing the meat extract of fish kept in seawater containing toluene which had the same smell as that of the offensive-smelling fish from near the oil refineries, it has been confirmed that toluene imparts the offensive-odour to fish near Mizushima. By gas chromatographic analysis of eels kept alive experimentally in seawater containing oil and their components, it has been proved that aromatic hydrocarbons (benzene and o-, m- and p-xylene) other than toluene and some aliphatic hydrocarbons are also probable substances that impart an offensive-odour to fish. Gasoline rich in olefine imparts offensive-odour to fish more than gasoline rich in paraffin or naphthene. (Holoman-Battelle)

TRACE METALS ANALYSIS ON SMALL OIL SAMPLES,
Texaco, Inc., Richmond, Va. Richmond Research Labs.
H. P. Woods.
Applied Spectroscopy, Vol 27, No 6, p 490, November/December 1973. 1 tab.

Descriptors: *Pollutant identification, *Trace elements, *Chemical analysis, *Oil, Heavy metals, Iron, Lead, Copper, Aluminum, Chromium, Boron, Methodology.
Identifiers: *Emission spectroscopy, *Trace levels, Lubricating oil, Motor oil, Silicon.

Quantities of oil as small as 0.5 ml have been analyzed for trace metals by direct reading emission spectroscopy with satisfactory results. A plastic cup was made as a sample holder. The capacity of this plastic container is approximately 3 ml; however, the container is partially filled with deionized water, and then the oil sample is floated on top of the water. Since the disc acts as a rotating skimmer, immersion of the disc to less than 1 mm is all that is needed for adequate sampling. This technique permits tests to be run routinely without modification to instrument or sample container. A similar technique could possibly be employed in the analysis of oils involving questions of environmental pollution, where after extensive concentration only a limited amount of samples may be available. A SIMPLE TURBIDIMETER FOR RAPID DETERMINATION OF LOW BACTERIA CONCENTRATIONS,
Consiglio Nazionale delle Ricerche, Naples (Italy). Laboratorio di Cibernetica.
A. Piccialli, and S. Piscitelli.
Review of Scientific Instruments, Vol 44, No 12, p 1717-1719, December 1973. 5 fig, 6 tab, 6 ref.

Descriptors: *Cultures, *Measurement, *Bacteria, Aquatic environment, Turbidity, Density, *Instrumentation.
Identifiers: *Turbidimeters, Bacterial concentration.

For detecting bacterial concentrations in very dilute media, a turbidimeter has been developed which reaches a sensitivity some three orders of magnitude greater than commercial instruments and without highly sophisticated photometric techniques. This differential photometric ratio systems consists of two photovoltaic cells which, operated in the linear section of their curves and

connected back-to-back, detect the intensity variations of the two optical paths. Staphylococcus aureus were used to measure the sensitivity of the instrument. Decreasing bacterial concentrations were read in triplicate; under the experimental conditions used, it is possible to reach the sensitivity in the range of 10,000-1,000,000 cells/ml. The advantages of this method with respect to the conventional ones are that the rapid and direct measurements of low bacterial densities offer new possibilities for the study of basic microbiological problems in natural aquatic ecosystems where bacteria are usually present in very low densities. (Holoman-Battelle)

AUTOMATIC RECORDING DILATOMETER,
Montreal Univ., (Quebec). Dept. of Chemistry.
P. Bernatchez, and D. Goutier.
Review of Scientific Instruments, Vol 44, No 12, p 1790-1791, December 1973. 2 fig, 1 tab, 8 ref.

Descriptors: *Automatic control, *Volume, *Variability, *Measurement, Automation, Electrical conductance, *Instrumentation.
Identifiers: *Dilatometers, Precision.

A dilatometer and an apparatus are presented which automatically records the height of the mercury column as a function of time. The precision of changes of 30 cm in height may attain plus or minus 0.007 cm. The stability of the electrical circuitry is such that measurements may span over several weeks. The measurement is based on electrical conductivity. An application is reported. (Holoman-Battelle)

EVALUATION OF MALONATE DULCITOL LYSINE IRON AGAR FOR PRESUMPTIVE IDENTIFICATION OF SALMONELLAE,
Oregon State Dept. of Agriculture, Salem. Lab. Services.
J. R. Stroup.
Journal of the Association of Official Analytical Chemists, Vol 57, No 1, p 95-100, January 1974. 4 tab, 12 ref.

Descriptors: *Pollutant identification, *Salmonella, Enteric bacteria, Pathogenic bacteria, Aerobic bacteria, Pollutants, E. coli, Shigella, Coliforms.
Identifiers: *Culture media, *Serotypes, *Iron agar(Malonate dulcitol lysine), Arizona hinshawii, Edwardsiella, Klebsiella, Proteus, Citrobacter, *Salmonellae, Method evaluation.

Malonate dulcitol lysine iron agar (MDLI) was evaluated, using 173 Salmonella subgenus I (19 serotypes) from 129 samples and 140 Salmonella subgenus III (Arizona hinshawii) from 17 samples. Sixty-four stock cultures were tested including 3 Salmonella subgenus II, 5 Salmonella subgenus IV, and 5 Edwardsiella tarda. Three hundred thirty-five non-Salmonellae from 81 samples were also studied. Only the Edwardsiella cultures and 1 other non-Salmonellae gave aberrant results in MDLI. Five of the known Salmonella serotypes tested and 2 serotypes isolated from samples gave atypical results. If MDLI is used to differentiate the subgenera, and lysine iron agar is used to confirm lysine decarboxylase for subgenera II, III, and IV, as well as act as a source of cells for '0' group serology, then the results of this study indicate that 305 (97.4 percent) of the 313 Salmonellae isolated from samples gave typical reactions within 30 hr. Biochemical and serological tests should be used to confirm cultures that give positive reactions. (Holoman-Battelle)

METHODOLOGY FOR RECOVERY AND IDENTIFICATION OF ENTEROPATHOGENIC ESCHERICHIA COLI,
Food and Drug Administration, Washington, D.C. Div. of Microbiology.
I. J. Mehlman, A. C. Sanders, N. T. Simon, and J. C. Olson, Jr.
Journal of the Association of Official Analytical Chemists, Vol 57, No 1, p 101-110, January 1974. 3 tab, 34 ref.

Descriptors: *Pollutant identification, *E. coli, *Pathogenic bacteria, *Enteric bacteria, *Methodology, Coliforms, Aerobic bacteria, Shigella, Separation techniques.
Identifiers: Culture media, Selective media, Recovery, *Biochemical tests, Fecal coliforms, Citrobacter diversus, Citrobacter freundii, Enterobacter hafniae, Klebsiella pneumoniae, Aeromonas, Yersinia enterocolitica, Proteus, Providencia, Enterobacteriaceae, Biochemical reactions.

Pathogenic biotypes of E. coli have been incriminated in food-borne illness. Sensitivity to evaluated temperature and a typical behavior precluded assessment of their incidence. A tentative recovery procedure involves direct streak, pre-enrichment in MacConkey broth at 35 C and transfer to lauryl tryptose broth at 35C and transfer to lauryl tryptose broth with incubation at 44C. Serological examination of enrichment simplifies analysis. Levin's eosin methylene blue agar is recommended for rapid lactose fermenters; MacConkey's agar should be used for low fermenters. Primary screening reactions include H2S, arabinose, urease, o-nitrophenyl-beta-D-galactosidase, and indole. Secondary reactions comprise lysine decarboxylase, Voges-Proskauer (at 22C), and other tests required to differentiate E. coli from Citrobacter diversus, C. freundii, Enterobacter hafniae, Klebsiella pneumoniae, and Shigella species. Slide and tube agglutination reactions are necessary for identification of somatic and capsular antigens. Enhancement of motility by serial passage in a semisolid medium is essential for recognition of flagellar antigen. Confirmatory reactions include nitrate reduction, cytochrome oxidase, and Gram stain. Potentiality for quantitation, applicability to animal pathogens, and ecological samples are discussed. EVALUATION OF EXISTING FIELD TEST KITS FOR DETERMINING FREE CHLORINE RESIDUALS IN AQUEOUS SOLUTIONS,
Army Medical Environmental Engineering Research Unit, Edgewood Arsenal, Md.
K. J. Guter, W. J. Copper, and C. A. Sorber.
Journal American Water Works Association, Vol 66, No 1, p 38-43, January 1974. 3 fig, 6 tab, 18 ref.

Descriptors: *Aqueous solutions, Methodology, *On-site tests, *Evaluation, *Chlorine, Colorimetry, Water temperature, Hydrogen ion concentration, Testing procedures, Chemical analysis, Water analysis, *Pollutant identification.
Identifiers: Precision, Synthetic water, Natural waters, Accuracy, Test kits, Syringaldazine procedure, N N-diethyl-p-phenylene diamine procedure, Comparative tests, Leuco crystal violet procedure, SNORT, Standard Methods.

An evaluation of five commercially available test-kit procedures that measure free available chlorine has been conducted on both synthetic water and five natural waters. The five techniques were syringaldazine (high range), syringaldazine (liquid), leuco crystal violet, N,N-diethyl-p-phenylene diamine (DPD), and SNORT, a neutral orthotolidine procedure. The following conclusions were drawn from results of the study. (1) Syringaldazine (liquid) was the most specific for FAC available (free chlorine) of the five test kits evaluated. (2) DPD was more accurate and precise over temperature and pH variation than were the other test-kits. (3) Syringaldazine (high range, leuco crystal violet, DPD, and SNORT all performed with satisfactory accuracy in the evaluation of natural waters. (4) Through 30 mg/l FAC, none of the test kits' colored-oxidized-indicator compounds was bleached by the high concentrations of FAC. (5) In evaluations of the natural water samples, only the organically polluted water resulted in appreciable false positive readings for the majority of the test kits. (6) Based upon the equilibrium constant, a negligible amount of HOCl will be present when combined chlorine concentrations in solutions are as high as 15 mg/l as C12. Therefore, false positive observations are probably due to some phenomenon other than reaction with HOCl present at equilibrium. (Mortland-Battelle)
W74-06162

THE DETERMINATION OF TANNIN AND LIGNIN,
Hach Chemical Co., Ames, Iowa. Technical Center.
M. B. Kloster.
Journal American Water Works Association, Vol 66, No 1, p 44-46, January 1974. 5 fig, 7 ref.

Descriptors: Methodology, *Pollutant identification, Water pollution, *Lignins, *Color reactions, *Spectrophotometry, Organic wastes, Organic compounds, Carbohydrates, Aromatic compunds, Industrial water, Waste water(Pollution), Chemical analysis.
Identifiers: *Chromogenic reagents, *Tannins, Folin-Ciocaltun reagent, Chemical interference, Precision, Chemical recovery, Phenolic compounds.

A new reagent has been developed that is not subject to some of the problems that arise with the traditional reagent presently recommended by 'Standard Methods' for determining tannin and lignin. The Folin-Denis, Folin-Ciocalteu reagents in combination with a carbonate reagent were tested using a 5 mg/l tannic acid solution which was prepared fresh daily. A precipitate formed with the Folin-Denis reagent and incomplete color development resulted. With the Folin-Ciocalteu reagent color development was very rapid upon the addition the carbonate reagent. At 20C maximum intensity was reached in about 60 min. After 25 min of development, the rate slows appreciably and the test gives good results if the development time is held within plus or minus 2 min. For the most sensitivity without appreciable loss of reaction rate, a ratio of 5 ml carbonate reagent/25 ml sample is recommended. For the best accuracy, the test should be run at above 20C and the temperature should be held within plus or minus 2C. These conditions will result in an error of less than 0.5 percent T. Any phenolic compound will give a positive interference when present in the sample being tested for tannin or lignin. Other reducing substances, notably sulfite and ferrous iron, will also give a positive interference. At 700 nm using

10-mm sample cells in an instrument with a 0.5 nm bandpass Beer's Law was obeyed from 0 to 7 mg/l tannic acid. At a concentration of 5.00 mg/l tannic acid, the standard deviation was plus or minus 0.075. After the addition of tannic acid to cooling tower water, the recovery was 96.6 percent at a level of 5 mg/l tannic acied. (Holoman-Battelle)

ALUMINUM IN FLUORIDATED DRINKING WATER: ANALYTICAL AND PHYSIOLOGICAL PROBLEMS,
Institute of Dental Research, Praque (Czechoslovakia). Chemical Dept.
J. A. Ruzicka, and L. Mrklas.
Journal American Water Works Association, Vol 66, No 1, p 53-55, Janurary 1974. 2 tab, 12 ref.

Descriptors: *Aluminum, *Potable water, *Fluorides, *Water pollution effects, Hydrogen ion concentration, Water quality, Spectrophotometry, Anions, Cations.
Identifiers: Sodium fluoride, Aluminum sulfate, Mice, Biological samples.

This study attempts to discover the relationship between free fluoride ion concentration and fluorine utilization by experimental mice administered solutions at different pH levels. The mice were fed a standard diet containing 2.4 mg fluorine per 1 kg dry weight. Five groups of thirteen animals each were formed, all of which were given distilled water to which was added sodium fluoride and aluminum sulphate, NaF and A12(SO4)3.18H20 at different pH levels. On termination of the experiment (the 21st day), the animals were sacrificed and the fluorine content in the ash of the tibiae was determined spectrophotometrically without separating the fluorine by distillation. Results have shown a decreased utilization of fluorine in solutions with a lower pH. At high pH levels the utilization of fluorine gradually increases. The fluorine interacts with the aluminum flocculant present in the solution. The utilization of fluorine is more influenced by aluminum cations than by aluminate anions, even though the utilization of fluorine is also reduced by aluminate. There was an obvious dependence of the proportion of free fluoride ion and also of total fluorine used by a living organism on an increased pH. However, the fluoride ion can by no means always be considered the main component of usable fluorine. Total fluorine determination seems to be a much better criterion. (Mortland-Battelle)

AN INEXPENSIVE TITRATION METHOD FOR THE DETERMINATION OF ORGANIC CARBON IN RECENT SEDIMENTS,
New Hampshire Univ., Durham. Dept. of Earth Sciences.
H. E. Gaudette, W. R. Flight, L. Toner, and D. W. Folger.
Journal of Sedimentary Petrology, Vol 44, No 1, p 249-253, March 1974. 1 fig, 2 tab, 11 ref.

Descriptors: *Water analysis, *Carbon, *Organic matter, *Sediments, Laboratory tests, Laboratory equipment, *Volumetric analysis.

Thirty-three samples of lacustrine and shallow marine sediments were analyzed for organic carbon content by a modified Walkey-Black titration method and by the LECO combustion method. Comparison of the two sets of data yields a regression line with a slope of 0.992, intercept of 0.00 and a correlation coefficient of 0.989; results obtained with the two methods agree precisely. Because the titration method involves little equipment or operator training it can be used at small laboratories and schools that lack sufficient funds or volume of samples to purchase or justify the faster but more expensive LECO apparatus. (Knapp-USGS)
W74-06284

OCCURRENCE AND ANALYSIS OF PETROLEUM HYDROCARBONS IN THE AQUATIC ENVIRONMENT,
Geological Survey, Menlo Park, Calif.
M. L. Yates.
Open-file report, January 1974. 40 p, 49 ref.

Descriptors: *Oil spills, *Pollutant identification, Gas chromatography, *Spectrophotometry, Fluorescence, Biodegradation, Sampling, *Water pollution sources, *Oil pollution.

Major sources of oil spills include crude oil production, manufacture of refined petroleum and petrochemicals and transportation and marketing of oil products. In 1970 over 2 million tons was lost to the marine environment. This amount will increase to an estimated 5 million tons per year by 1980. To be able to characterize and estimate the amount of hydrocarbon residue it is necessary to have analytical techniques for the determination of petroleum and natural hydrocarbons in the aquatic environment. Usually solvent extraction of an environmental sample is followed by an analytical cleanup step which also may provide some chemical class separations. Qualitative characterization is primarily by flame ionization gas chromatography. Infrared spectrometry, fluorescence and elemental analysis are often required for complete analysis. Both qualitative and quantitative assessments are made more difficult by degradation from weathering and biological transformation occurring within the aquatic environment. (Knapp-USGS)

Descriptors: *Remote sensing, *Atlantic Coastal Plain, *Aerial photography, Land use, *Data collections, Water quality, Sedimentation, Urbanization, *Water pollution, *Chesapeake Bay.

Surface observations of coastal waters in the Chesapeake Bay region and ground truth data were obtained to aid interpretation and analyses of overflight photography and imagery. Among the objectives of the mission was to investigate the potential of high-altitude, multispectral photography. The site encompasses a major segment of the mid-Atlantic coast from Newark, New Jersey to Wilmington, North Carolina. It includes the southern portion of Megalopolis, one of the world's major urban-industrial complexes. It encompasses the silt and pollutant laden Chesapeake drainage system, the largest on the U.S. east coast. The site includes seaward reaches of the Delaware River system where water quality management is the chief problem. Additionally, it includes the coastal parts of North Carolina which offers a wide range of physical environments and cultural development common to the east coast. Large spatial and temporal variations occur in these tidal waters. (Knapp-USGS)

UTILIZATION OF BARK WASTE,
Oregon State Univ., Corvallis. Dept. of Forest Products.
R. A. Currier, and M. L. Laver.
Available from the National Technical Information Service as PB-221 876; $6.00 in paper copy, $1.45 in microfiche. Environmental Protection Agency, Cincinnati, Ohio, Final Project Report EPA-670/2-73-005, 1973. 179 p, 7 fig, 14 tab, 88 ref.

Descriptors: *Wood wastes, *Bark, *Solid wastes, *Waste disposal, Ultimate disposal, *Economic feasibility, *Marketing, Research and development, Particle size, Particle shape, Softwood, Ammonia, Bonding, Adhesion, Cohesion, Moisture content, Carbohydrates, Chemical analysis.
Identifiers: Wood products, Pellets, Molded wood articles, Pelleting(Pelletizing), Plant waxes, Chemically modified wood, Bark extractives.

In attempts to find economic market potentials for vast amounts of tree bark waste generated by the wood-using industries, research studies were conducted on (1) the preparation of bark pellets under controlled conditions and process variables, such as particle size and shape, moisture content, and addition of chemical reagents; (2) the identification of components responsible for self-bonding of bark, such as carbohydrates, waxes, and related extractives; (3) the preparation of ammoniated and other chemically modified bark products; (4) the chemical analysis of bark products, such as bark that had been molded into pellets and then comminuted. Progress along each of these approaches is reported, and recommendations for further investigations are made. (Brown-IPC)

THE PCB STORY,
S. Jensen.
Ambio. Vol 1, No 4, p 123-131. 1972. Illus.
Identifiers: *Eagle(White-tailed), Japan, Law, *Pike, *Salmon, *Sweden, Reviews, *Pollutant identification, *Polychlorinated biphenyls.

The history of, and difficulties inherent in, the identification of polychlorinated biphenyls in the environment are related. The identity of unknown substances in a white-tailed eagle found dead in the archipelago of Stockholm, Sweden, and young salmon and pike was verified by a comparison with the mass spectrometric and gas chromatographic data of a synthetic chlorinated biphenyl mixture. Literature reviews on world wide research and scientific articles concerning contaminants and stability are cited. The uses of PCB in Sweden, biological effects, the law ban in Sweden and a comparison of blood levels in some Japanese and Swedish people are discussed.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: Water analysis, *Analytical techniques, *Phenols, *Chromatography, *Pulp wastes, Solvents, Water pollution sources, Monitoring, Effluents, Waste water(Pollution), *Pollutant identification.
Identifiers: Pyrocatechol, Hydroquinone, Resorcinol.

A descending paper chromatographic technique is described which was used in conjunction with photocolorimetry to determine pyrocatechol, 4- and 3-methyl and 4-ethyl pyrocatechols, methyl ethyl pyrocatechol, hydroquinone, and resorcinol in effluent samples from various pulp and paper mills. The substrate used was Whatman No. 1 filter paper preconditioned by saturation with water vapor for 3 days at 20 C. The developing solvent was a mixture of 94 parts (v/v) of carbon tetrachloride, 6 parts of n-butyl alcohol, and 100 parts of water. This solvent mixture advanced at the rate of 500 mm per 5-9 hr. Dried chromatograms were developed with ammoniacal silver nitrate solution and stabilized, after washing, with aqueous sodium thiosulfate solution. (Trubacek-IPC)

PHENOLIC COMPOUNDS IN SPENT PULPING LIQUORS AND PULP MILL EFFLUENTS (ZWIAZKI FENOLOWE W LUGACH I SCIEKACH Z CELULOZOWNI),
Instytut Celulozowo-Papierniczy, Warsaw (Poland).
B. Pszonka.
Przeglad Papierniczy, Vol 29, No 7, p 254-256, July 1973. 33 ref.

Descriptors: *Phenols, Water analysis, *Colorimetry, Toxicity, *Pulp wastes, *Sulfite liquors, *Lignins, Analytical techniques, Effluents, Pulp and paper industry, Europe, *Pollutant identification.
Identifiers: Sulfite pulp mills, Spent sulfite liquors, Poland.

Contrary to optimistic views reported by earlier investigators abroad, recent gas-chromatographic analyses of sulfite pulp mill effluents indicate that the degradation of lignin can and does give rise to toxic simple phenolic compounds, such as phenol, cresols, and xylenols. Most antipollution standards are based on colorimetry of phenols, using various reagents, such as 4-aminoantipyrine, p-nitroaniline, and tungsten-molybdenum reagent. These reactions may be sensitive, but are nonspecific. They detect all phenolic compounds, including vanillin and other nontoxic components of mill discharges. The detectable amounts of phenols also vary with different reagents used. Further refinement of analytical techniques and better knowledge of the biodegradation of wood-derived effluent components are desirable objectives of future research. (Stapinski-IPC)

RAPID DETERMINATION OF CHEMICAL OXYGEN DEMAND IN WASTE WATERS OF WOOD-CHEMICAL FACTORIES (USKORENNOE OPREDELENIE KHPK STOCHNYKH VOD ASHINSKOGO LESOKHIMICHESKOGO KOMBINATA),
G. A. Ishcherikova, and N. P. Drozdov.
Gidroliznaya i Lesokhimicheskaya Promyshlennost', No 6, p 25-27, 1973. 2 tab, 1 ref.

Descriptors: *Chemical oxygen demand, *Water analysis, *Analytical techniques, *Pulp wastes, Waste water(Pollution), Monitoring, Oxygen demand, Water pollution sources, Industrial wastes, Foreign research, *Pollutant identification.
Identifiers: Potassium dichromate, USSR.

Because the standard dichromate method of COD determination requires ca. 2 hr of sample heating, an accelerated modification was developed at the Ashinsk wood-processing factory in the USSR. Its principle is the same as in the standard method, but the heating time is shortened to 15 min. A 10-ml sample of the waste water to be tested is mixed with potassium dichromate with gradual addition of sulfuric acid. If chlorides are present, a small amount of mercury sulfate is added. The mixture is heated on a sand bath for 15 min, then cooled, diluted with water, and titrated with 0.1N solution of Mohr's salt in the presence of 0-phenanthroline. The rapid method was tested on effluents of rosin and turpentine manufacturing plants and showed good agreement with results of the longer standard method. (Stapinski-IPC)

EMISSION SPECTROMETRIC DETERMINATION OF ARSENIC,
Colorado State Univ., Fort Collins. Dept. of Chemistry.
F. E. Lichte, and R. K. Skogerboe.
Anal Chem. Vol 44, No 8, p 1480-1482. 1972. Illus.
Identifiers: *Arsenic, *Wyoming(Yellowstone National Park), *Pollutant identification, *Spectrophotometry, Pools, Trace elements.

An arsine generator was coupled directly to the excitation plasma, and the generator system was optimized to permit the rapid, quantitative removal of arsenic from an aqueous sample obtained from Morning Glory Pool in Yellowstone National Park. The system offered high sensitivity; the detection capability, which was primarily limited by the reagent blank, was approximately 5 ng. Less than 5 parts per billion of arsenic were determined when a 1-ml sample was used. The sensitivity that was obtained, coupled with the relative simplicity of the instrumentation required, suggested that this method should find widespread application in problems requiring the determination of trace amounts of arsenic.--Copyright 1973, Biological Abstracts, Inc.

CHEMICAL AND SEDIMENT MOVEMENT FROM AGRICULTURAL LAND INTO LAKE ERIE, SUPPLEMENT REPORT,
Ohio State Univ., Dept. of Agricultural Engineering.
G. O. Schwab, and E. O. McLean.
Available from the National Technical Information Service as PB-230 515, $3.00 in paper copy, $1.45 in microfiche. Ohio State University, Water Resources Center, Supplement Report, Project 390X, November 1973. 15 p, 9 tab, 3 ref. OWRR A-018-OHIO (2), 14-01-0001-3535.

Descriptors: *Water quality, *Sediment discharge, *Pesticide removal, Drainage systems, Drainage water, Nitrogen, Phosphorus, Nutrient removal, *Lake Erie, *Ohio, Tile drains, Clays, Oats, Runoff, Heavy metals, Alfalfa, Iron, Lead.
Identifiers: Sandusky(Ohio).

Water quality from tile drains and surface runoff was measured from half acre plots on Toledo silty clay soil near Sandusky, Ohio, in 1972. Crop was oats in early part of the growing season followed by plowing and seeding to alfalfa in September. Relative losses of sediment and chemical ions for the two drainage systems were similar to those of the previous three years. Growing season sediment losses from the tile drains were 3,714 lbs per acre in 1972 compared to an average of 1,071 lbs per acre for 1969-71. The corresponding losses from surface drains were 6,854 and 1,287 lbs per acre. All pesticide losses were insignificant, but none were applied in 1972. Annual losses of eight heavy metals in 1972 were estimated to be less than 10 lbs per acre, except for iron (34-59) and lead (11-15 lbs per acre). (See also W73-01957)

TRANSFER OF HEAVY METAL POLLUTANTS FROM LAKE ERIE BOTTOM SEDIMENTS TO THE OVERLYING WATER,
Bowling Green State Univ., Ohio. Dept. of Geology.
L. J. Walters, Jr., and T. J. Wolery.
Available from the National Technical Information Service as PB-230 380, $4.00 in paper copy, $1.45 in microfiche. Ohio State University Water Resources Center Project Completion Report No. 421X, January 1974. 84 p, 12 fig, 7 tab, 60 ref. OWRR A-032-OHIO (1).

Descriptors: *Mercury, *Chromium, *Nickel, *Mass transfer, *Sedimentation rates, *Lake Erie, Diffusion, Heavy metals, Water pollution sources, Path of pollutants, Sediment-water interfaces, *Bottom sediments.

Analyses of surface waters, surface microlayers, and interstitial waters all showed negligible mercury contents in Lake Erie samples. A series of extractions on six sediment samples showed that the mercury was present in essentially three components: (1) high molecular-weight organic acids (30-54%), 2) lower molecular-weight organic acids believed to be held as insoluble complexes with iron under in situ conditions (5-20%), and (3) a sulfide (plus refractory organic) component (24-62%). Detailed depth profiles for mercury, nickel, and chromium in Lake Erie sediment cores showed that mercury was enriched in the surface sediments up to 114 times background levels. Chromium was typically enriched by a factor of 2-7, and nickel from 1-2. Geographically, the Western Basin showed the highest degree of heavy metal enrichment, and the Eastern Basin the least. Pollutant mercury horizons were used to obtain sedimentation rates in the Western Basin. A simplified model for the effect of sedimentation rate on the eventual remobilization of mercury via methylation showed two areas of high relative remobilization. The high sedimentation rates appear to be capable of negating the mercury hazard in the rest of the Basin without assistance from man.

RIVERINE RECREATIONAL DEVELOPMENT--MATHEMATICAL MODELING,
Carnegie-Mellon Univ., Pittsburgh, Pa. Dept. of Civil Engineering.
R. M. Shane, H. J. Day, S. M. Frenkil, and P. H. P. Ho.
Available from the National Technical Information Service as PB-230 434, $7.50 in paper copy, $1.45 in microfiche. Interim Research Report R735-5, September 1973. 83 p, 15 fig, 21 tab, 21 ref. OWRR C-2183(3381) (1).

Descriptors: *Water quality, *Recreation, Mathematical models, *Pennsylvania, Planning, Urban sociology, Water sports, Rivers, Recreation demand, Swimming, Fishing, Boating, *Computer models, *Simulation analysis.
Identifiers: *Urban recreation, Pittsburgh(Penn), *Allegheny River(Penn).

A computer simulation model is being developed to make water quality projections for planning urban recreation. These projections should reflect basin-wide waste load contributions from both point and nonpoint sources of pollution. The model should project expected pollutant concentrations at key recreational areas in such a way that they reflect alternative socioeconomic and land use projections for the watershed area as well as alternative treatment strategies for point and areal sources of pollution. Another model should project recreational participation at individual sites in a region according to points of origin as well as user characteristics that include age and income. The model should include a water quality parameter to allow the effects of deteriorating or improving water quality conditions to be reflected in the recreational participation projections. One of the goals of this research is to evaluate the recreational potential of the Allegheny River, particularly that portion closest to the city of Pittsburgh. The present water quality of the Allegheny River is suitable for boating and general fishing; BUT IT IS NOT SUITABLE FOR SWIMMING OR ACTIVE GAME FISHING AT THIS TIME. (Knapp-USGS)

LAKE ERIE, OHIO, PENNSYLVANIA, NEW YORK INTAKE WATER QUALITY SUMMARY, 1970.
Environmental Protection Agency, Chicago, Ill. Region V.
Available from NTIS, Springfield, Va 22151 as PB-214 946. Price $6.00 printed copy; $1.45 microfiche. Cooperative Program Report, August 1971. 311 p, 1 fig, 8 tab.

Descriptors: *Water quality, *Lake Erie, *Municipal water, Water analysis, Water chemistry, Dissolved oxygen, Data collections, Hydrologic data, *New York, *Pennsylvania, *Ohio, Intake.

A summary of progress is given for the cooperative water quality surveillance program between the Ohio Department of Health, New York State Department of Environmental Conservation, Pennsylvania Department of Environmental Resources, municipalities, and the Environmental Protection Agency at 22 water treatment intakes in Lake Erie. Analytical characterizations include continuous temperature recording, pH, conductivity, total dissolved (filterable) solids, turbidity, total iron, total manganese, chloride, sulfates, total bacteria, total and fecal coliforms, alkalinity, hardness, and chlorine demand. In addition, analytical characterizations on Buffalo's intake water include color, total solids, biochemical oxygen demand, chemical oxygen demand, total phosphorus, fluoride, and methylene blue active substance (anionic detergents). In addition, the EPA is making the following biweekly determinations; DO, turbidity, total solids, total dissolved (filterable) solids, total suspended (nonfilterable) solids, dissolved silica (Si02), total phosphorus, soluble phosphorus, organic nitrogen, ammonia, nitrate, chemical oxygen demand, total coliforms, fecal coliforms, total bacterial counts (SPC), and plankton evaluations. BOMB-PRODUCED TRITIUM IN THE ANTARCTIC OCEAN,
Scripp: Institution of Oceanography, La Jolla, Calif.
R. Michel, and P. M. Williams.
Earth and Planetary Science Letters, Vol 20, No 3, p 381-384, November 1973. 2 fig, 1 tab, 12 ref. NSF Grant 25952 and GV-27110.

Descriptors: *Tritium, *Ocean circulation, *Sea water, *Antarctic, Water circulation, Ocean currents, Mixing, Tracers, Fallout.

Tritium measurements for 24 samples from the Antarctic Ocean are given. High tritium concentrations are found in certain deep water masses, indicating an input of surface water into these masses in the last 10 to 20 years. The most rapid exchange of surface water with the deep ocean layers occurs at high northern and southern latitudes wherever strong overturn exists. (Knapp-USGS)

Earth and Planetary Science Letters, Vol 20, No 1, p 35-44, September 1973. 8 fig, 1 tab, 18 ref. AEC Contracts AT (30-1)3139 and AT (11-1) 3180.

Descriptors: *Tracers, *Path of pollutants, *Sea water, *Radium radioisotopes, Biodegradation, Nutrients, Plant growth.
Identifiers: *Thorium.

The activity ratio of Th-228 to Ra-228 in the open ocean averages 0.21. This suggests that thorium is removed from surface water in about 0.7 yr. As plant matter is cycled within the surface sea on a similar time scale, highly reactive compounds may be removed by plants in their use of nitrate and phosphate. Combined with the coefficient for horizontal eddy diffusivity obtained from the distribution of Ra-228 in surface sea water this result provides a basis for the prediction of the distribution of reactive pollutants released to the surface sea from coastal areas. Descriptors: *Model studies, *Mercury, *Path of pollutants, *Environmental effects, Water pollution effects, Soils, Fish, Mud, Air, Air pollution, Heavy metals, Cycles.
Identifiers: *Data interpretation.

Data on the distribution and translocation of mercury in the environment are summarized to determine whether the mercury balance has been disturbed by man's activities and whether additional research is required. A model based on System Dynamics methodology was developed to identify research needs, assess the persistence of mercury as a pollutant, and analyze policies for controlling mercury pollution. This model traces the path of mercury from its natural sources to its natural sinks. By superimposing the effect of man's activities on the natural flow of mercury, the effect of industrial and agricultural consumption on mercury contamination in the world system can be examined. Although the model is not complete several conclusions result from the available data: Mercury pollution of soils and streams is primarily a local problem; mercury levels in marine fish may rise above acceptable levels if the consumption of resources with one ppm mercury or more continues. Further experimental research is needed to obtain data on the

mercury content of fossil fuels, on possible natural mechanisms for the release of mercury into the air, and on conversion mechanisms for methylation of mercury in the soil, ocean, and fish sectors. (Little-Battelle)

Identifiers: *North Sea, Mineral oil, Titanium dioxide, Synthetic fibers.

A literature review indicates that pollutants in the North Sea, which serves as a catchment area for part of Britain, Belgium, Holland, Luxemburg, most of Germany, and parts of Switzerland, Czechoslovakia, Denmark, and Norway are introduced by rivers, direct dumping from the coast, ship dumping, fallout, shipping, and offshore oil production. Pollutants identified are salts from potash mines, Phosphates from urban sewage, heavy metals (cr, Mn, Fe, Ni, Cu, Zn, Cd, Hg, Pb, and As), pesticides, nitrates, ammonia, nitrites, PCBs, phenols, mineral oil, titanim dioxide wastes, ash, synthetic fiber waste, enzyme waste, resin waste, acids, sewage sludge, oil, wood and plastic packing material, bottles, kitchen waste, and ship wash water. Although limited data are available, it is concluded that the North Sea is one of the most polluted areas of the world. (Little-Battelle)

METHYL MERCURY ACCUMULATION IN AN AQUATIC FOOD CHAIN. A MODEL AND SOME IMPLICATIONS FOR RESEARCH PLANNING,
Swedish Water and Air Pollution Research Lab., Stockholm.
T. Fagerstrom, and B. Asell.
AMBIO, Vol 2, No 5, p 164-171, 1973. 4 fig, 1 tab, 19 ref.

Descriptors: *Mercury, *Food chains, *Mathematical models, Industrial wastes, Water pollution effects, Pikes, Diptera, Ecosystems, Absorption, Respiration, Metabolism, *Path of pollutants, Heavy metals, Equations.
Identifiers: *Methylmercury, Roach, Biological magnification, Bioaccumulation.

A mathematical model was utilized to study the mechanisms of methyl mercury accumulation in aquatic food chains. The three step food-chain model has pike feeding on roach and roach feeding on chironomids. Functions in the model include environmental variables and equations describing some ecological and ethological processes that determine the flow of energy. The discussion is limited to three specific problems. (1) Is the model at all able to mimic, in a qualitative sense, the static picture that is common in nature, ie MM concentrations in fish increasing with age, and concentrations in predatory species exceeding those in prey species by a factor of two-five. (2) What is the relative importance of the accuracy of the numerical values for the calculated MM concentrations in the fish. (3) What are the dynamics of the reaction of the system to perturbations in the same simulations as were used for the sensitivity analysis. (Mortland-Battelle)

Identifiers: *Mirex, Bioaccumulation, Animal tissues, Data interpretation, Chemical recovery, Sample preparation, Biological magnification, Electron capture gas chromatography, Finfish, Sampling frequency, Muscle, Log Bridge Creek, Old Town Creek, Beresford Creek, Alligator Creek, Toogoodoo Creek, Riverland Terrace Pond, Stono River, Ashley River, Cooper River, Wando River, South Santee River, Blue crab, Common mud crab, Mud crab, Portunid crab, Sand fiddler crab, Brown shrimp, Brown-spotted shrimp, Grass shrimp.

In conjunction with a fire ant eradication program during which mirex was aerially applied to coastal areas near Charleston, S.C., field studies were conducted to Monitor the movement and accumulation of mirex in the estuarine system. Collections of background and periodic posttreatment samples of water, bottom sediments, shrimp, crabs, fish, and estuary-dependent birds and mammals were analyzed for mirex using electron-capture gas chromatography. The data revealed that (1) mirex was translocated from treated lands and high marsh to estuarine biota - all animal classes sampled contained mirex; and (2) biological concentration of mirex occurred - especially in predators such as racoons and birds. Mirex residue ranges for respective sample categories were: water (less than 10.01 ppb); sediment (0-0.07 ppm); crabs (0-0.60 ppm); fishes (0-0.82 ppm); shrimps (0-1.[illegible] ppm); mammals (0-4.4 ppm); and birds (0-17.[illegible] ppm)). No mass mortalities were observed during the study. (Holoman-Battelle)

FACTORS AFFECTING THE BEHAVIOR OF FIVE CHLORINATED HYDROCARBONS IN TWO NATURAL WATERS AND THEIR SEDIMENTS,
Simon Fraser Univ., Burnaby (British Columbia). Dept. of Biological Sciences.
P. C. Oloffs, L. J. Albright, S. Y. Szeto, and J. Lau.
Journal of the Fisheries Research Board of Canada, Vol 30, No 11, p 1619-1623, November 1973. 3 tab, 5 ref.

Descriptors: *Bottom sediments, *Pesticide kinetics, *Environmental effects, Water pollution, Chlorinated hydrocarbon pesticides, *Path of pollutants, Laboratory tests, DDT, DDD, Pesticide residues, Polychlorinated biphenyls, *Canada.
Identifiers: Fraser River(B.C.), Georgia Strait(B.C.), *Chlorinated hydrocarbons, Natural waters, Chemical recovery, alpha-Chlordane, gamma-Chlordane, Agitation.

Water samples from the Fraser River and Georgia Strait, British Columbia, were treated with different chlorinated hydrocarbons and incubated for up to 12 weeks at 13C. (1) In the presence of bottom sediments from the same locations as the waters, no residues were found to escape into the atmosphere. (2) With the exception of lindane in ocean water, all detectable residues had moved into the sediments after 6 weeks. (3) Most of the lindane was metabolized. (4) Sterlilization of the waters and sediments prevented the metabolism of lindane but had little effect on DDT and DDD. (5) Agitation of water samples containing gammg-chlordane, incubated without sediment, had no effect on its disappearance, but the presence of 0.01 percent of a nonionic surfactant retarded this almost completely. ATTACHMENT OF BACTERIA TO SULPHUR IN EXTREME ENVIRONMENTS,
Indiana Univ., Bloomington. Dept. of Microbiology.
R. L. Weiss.
Journal of General Microbiology, Vol 77, No 2, p 501-507, August 1973. 4 fig, 10 ref.

Descriptors: *Sulphur bacteria, *Hot springs, *Adhesion, Hydrogen ion concentration, Cultures, Incubation, Sediments, Electron microscopy, Sulfur, Water temperature, Sampling.
Identifiers: Sulfolobus, Pili, Media, Yellowstone National Park.

Sulfolobus attaches to sulphur deposited in acid hot springs by means of pili characterized as follows: (1) generally irregular shape with slight curves and bends: (2) adhesiveness that enables bacteria to attach to sulphur; (3) acid-stable, resistant to pH values as low as 2; (4) heat-stable, resistant to temperatures as high at 75C. Sulfolobus attached to sulphur in nature and in culture eroded the sulphur crystal where the bacteria were attached. Sulfolobus undergoes the following two forms of attachment: (1) to sulphur by pili which separate the bacterium from the sulphur crystal and permit lateral movement of bacteria; (2) to glass slides by firm adhesion of the wall to the sur-

face of slide. Attachment to sulphur in flowing springs enables Sulfolobus to colonize these low pH (2 to 3) high temperature (70 to 75C) habitats. (Mortland-Battelle)

THE DISTRIBUTION OF HEAVY METALS IN REEF-DWELLING GROUPERS IN THE GULF OF MEXICO AND BAHAMA ISLANDS,
Texas A and M Univ. College Station. Dept. of Oceanography.
D. D. Taylor, and T. J. Bright.
Available from the National Technical Information Service as COM-73-11311; $6.25 in paper copy, $1.45 in microfiche. Report No. TAMU-SG-73-208, May 1973. 267 p, 17 fig, 62 tab, 218 ref. Contract No. 043-158-18.

Descriptors: *Gulf of Mexico, *Distribution patterns, *Heavy metals, Reefs, Mercury, Cadmium, Lead, Copper, Zinc, Growth rates, Animal metabolism, Habitats, Reproduction, Food habits, Trophic levels, Animal growth, Water pollution effects, Phosphates, Sea water, Oceans, Sampling, Spectrophotometry, Colorimetry, Sediment transport, Depth, Water temperatures, Salinity, Marine fish, Pollutant identification, Sea basses.
Identifiers: *Bahama Islands, *Groupers, Animal tissues, Bioaccumulation, Epinephelus striatus, Mycteroperca, Muscle, Liver, Sample preservation, Otoliths, Flameless atomic absorption.

Grouper species of the Epinephelus complex (Family Serranidae) from reefs or reef banks in the Gulf of Mexico and Caribbean Sea were analyzed for heavy metals (Hg, As, Cd, Pb, Cu, Zn). Almost all showed levels below those generally deemed dangerous to humans. Geographical variations for mercury were detected, but must be viewed in light of regional differences in trophic structure and various other factors. Correlation between concentrations of heavy metals and growth factors (age, weight, standard length) indicated differences between members of the same species as well as interspecific differences. Mercury and zinc appear to increase with age and size in certain groupers, whereas arsenic shows absolutely no correlation. Interspecific differences, particularly in the accumulation of mercury and arsenic, were demonstrated between Epinephelus striatus and the three species, Mycteroperca tigris, M. phenax, and E. cruentatus. These differences reflect possible variations in feeding habits and metabolism. Therefore, extrapolation of data from one species to another is invalid, as if lumping species to represent a trophic level. High levels of arsenic in reef organisms appear to be related to the substitution of arsenate for phosphate in biological systems. A hypothesis is proposed whereby low phosphate reef waters result in accumulation of arsenic by reef organisms, implying a natural mechanism rather than a pollution problem. Subtle biogeochemical cycles like this one caution against the use of a heavy metal content as a direct index to pollution levels. (Mortland-Battelle)

HYDROCARBON-OXIDIZING BACTERIA AND THEIR POSSIBLE USE AS CONTROLLING AGENTS OF OIL POLLUTION IN THE OCEAN,
Naval Weapons Center, China Lake, Calif. Research Dept.
G. Soli.
Available from the National Technical Information Service as AD763-655 $3.00 in paper copy, $1.45 in microfiche. Technical Report No. 3, July 1973. 11 p, 3 tab, 7 ref.

Descriptors: *Microbial degradation, *Oil spills, *Marine microorganisms, *Water pollution control, Marine bacteria, Biodegradation, Oceans.
Identifiers: *Hydrocarbon-oxidizing bacteria, *Substrate utilization, Heterotrophic bacteria, Aromatic hydrocarbons, Aliphatic hydrocarbons, Synthetic oil, n-Paraffins, Isoparaffins, Cycloparaffins, Bacterial physiology, Farnesane, Pristane, Phytane, Squalene, Decalin, Bicyclohexyl, Heptycyclohexane, Marine environment.

Attempts were made at characterizing marine bacterial isolates on the basis of their ability to attack hydrocarbons in a complex synthetic mixture. By balancing properly the various components, it is possible to outline the oil degradation range of the organisms. By using different nitrogen sources, both organic and inorganic, it is also possible to determine indirectly the degree of specialization and adaptation to hydrocarbon oxidation. A broad classification of hydrocarbonoclastic bacteria is discussed, and routes of attack of the various types of hydrocarbons are examined. (Holoman-Battelle)

BIODEGRADATION OF OIL,
Houston Research, Inc., Tex.
S. J. Sedita.
Available from the National Technical Information Service as AD-763 467 $3.00 in paper copy, $1.45 in microfiche. Final Report, June 30, 1973. 48 p, 5 fig, 10 tab, 11 ref. Contract No. N00014-72-C-0471.

Descriptors: *Oil wastes, *Microbial degradation, *Biodegradation, Organic matter, Sea water, Water pollution control, Oil pollution, Marine bacteria, Laboratory tests, Cultures, Nutreients, Nitrogen, Pseudomonas, Carbon, Oxidation.
Identifiers: Bunker C oil, *Hydrocarbon-oxidizing bacteria, Substrate utilization, Fuel oil, Motor oil, Fate of pollutants, Culture media, Gaffkya tetragena, Micrococcus lysodeikticus, Mycobacterium smegmatis, Proteus vulgaris, Pseudomonas aeruginosa, Corynebacterium spp, Bacillus, Arthrobacter, Streptomyces, Flavobacterium, Achromobacter, Alcaligenes, Sonication, Silica gel chromatography.

This study was carried out to determine the feasibility of using partially disrupted microorganisms in conjunction with intact cells to accelerate the oxidative degradation of hydrocarbons. Initially, 40 plus organisms were isolated which were capable of degrading some fraction of Bunker 'C' residual fuel oil. These organisms spanned the spectrum of genera from Micrococci to Streptomyces. Those organisms capable of degrading various hydrocarbon fractions were isolated not only from the oil rich sources, but from university culture collections. Various 'recipes' of organisms were tested under laboratory and large scale conditions to determine their effectiveness in degrading Bunker 'C' residual fuel oil. Several conclusions were reached: Isolation of microorganisms capable of degrading hydrocarbons may be accomplished with relative ease. Many genera are capable of degrading at least one of the major fractions of Bunker 'C' residual oil. Laboratory evaluation of hydrocarbon oxidation should be based on more than one parameter, including disappearance or change of substrate. Although individual organisms were capable of degrading Bunker 'C' residual, a recipe of organisms had less removal capacity in the laboratory and in large tanks. Made to order recipes of organisms, based on their individual capabilities may not be the best approach to large scale removal of Bunker 'C'. More work on the generic and specific composition of artificial mixtures of microorganisms in this context is required. Mixtures formulations should be restricted to as few organisms as possible, and obviously to those which exhibit no inhibitory effects on other organisms. (Mortland-Battelle)

A PRELIMINARY NOTE ON THE SEQUENTIAL DECOMPOSITION OF PECTIN BY AQUATIC BACTERIA,
Freiburg Univ. (West Germany). Limnologisches Institut.
H. Gude, and W. Reichardt.
Water Research, Vol 7, No 12, p 1881-1883, December 1973. 1 fig, 8 ref.

Descriptors: *Microbial degradation, *Aquatic bacteria, Biodegradation, Growth rates, Cultures, Enzymes, Organic compounds, Carbohydrates, *Eutrophication.
Identifiers: *Pectin, *Fate of pollutants, Flavobacterium, Cytophaga, Substrate utilization, Enzyme production, Heterotrophic bacteria, Culture media, *Germany(Mindel Lake).

In the eutrophic Mindel Lake near Constance, W. Germany, the total viable heterotrophic and aerobic bacteria on caseine-peptone-starch-agar (Collins and Willoughby, 1962) as well as their pectolytic portion were counted during the main periods of plankton vegetation and decomposition (from August till February). An inverse relationship was observed between total aerobic heterotrophic bacteria and their pectolytic share which consisted mainly of Flavobacterium-Cytophaga species. When grown in a medium containing pectin and yeast extract as organic compounds pure cultures of the most abundant type of this bacterial group showed a diauxic characteristic of growth. A short time before entering the first lag phase of growth, production of pectolytic enzymes increased until the end of the second log phase of growth. This phenomenon may be due to the mechanism of a catabolic repression and derepression. (Mortland-Battelle)

ELECTRON DONOR-ACCEPTOR REAGENTS IN THE ANALYSIS OF PESTICIDES. VII. A SIMPLE MODEL SYSTEM HYDROLYSIS OF SOME CARBAMATE PESTICIDES,
Dalhousie Univ., Halifax (Nova Scotia). Trace Analysis Research Centre.
J. D. MacNeil, R. W. Frei, M. Frei-Hausler, and O. Hutzinger.
International Journal of Environmental Analytical Chemistry, Vol 2, No 4, p 323-330, 1973. 4 fig, 1 tab, 9 ref.

Descriptors: *Carbamate pesticides, *Degradation(Decomposition), *Chemical analysis, *Hydrolysis, Aqueous solutions, Persistence,

Hydrogen ion concentration, Pesticide kinetics, Stability, Insecticides, Herbicides, Chlorinated hydrocarbon pesticides, Pollutant identification, *Chromatography, *Spectroscopy.
Identifiers: Reflectance spectroscopy, Thin layer chromatography, Complexing reagents, Hydrolysis products, Carbaryl, Mobam, IPC, CIPC, 9-Dicanyomethylene-2 4 7-trinitrofluorene, Complexation, alpha-Naphthol.

The decomposition of the carbamate insecticides carbaryl and Mobam and the herbicides IPC and CIPC in water at various pH's was investigated. Analyses were preformed in situ on silica-gel thin-layer chromatograms by reflectance spectroscopy after the developed chromatograms had been sprayed with the regent CNTNF (9-dicyanomethylene-2,4,7-trinitrofluorene) to form visible pi-complexes of the pesticides. The experiments indicate that the N-methyl carbamate insecticides studied decompose fairly rapidly in water at alkaline pH's and that this process occurs more rapidly as the water becomes more basic. Reaction occurs more slowly at neutral pH and the compounds appear quite stable at acid pH. Similar behavior was observed with the major hydrolyzed products in basic media, but these appear to be more persistent than the parent pesticides. The N-phenyl carbamates studied appear to persist under both acidic and alkaline conditions. The results suggest that the persistence in water of the pesticides studied and also of their major products, as well as the many other related pesticides in common use, should be the subject of further investigation. PHOTODECOMPOSITION OF CHLORINATED BIPHENYLS AND DIBENZOFURANS,
California Univ., Davis. Dept. of Environmental Toxicology.
D. G. Crosby, and K. W. Moilanen.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 6, p 373-377, December 1973. 1 fig, 1 tab, 33 ref.

Descriptors: *Polychlorinated biphenyls, *Gas chromatography, Irradiation, *Mass spectrometry, *Degradation(Decomposition), Pollutant identification, Spectrophotometry.
Identifiers: *Photodecomposition, Degradation products, *Chlorodibenzofurans, GC-Mass spectrometry, Fate of pollutants, Photolysis, 2 8-Dichlorodibenzofuran, 2-Chlorodibenzofuran, 2 5-Dichlorobiphenyl, 2 2' 5 5'-Tetrachlorobiphenyl.

Chlorinated biphenyls and dibenzofurans were irradiated in an aerated, sunlight-simulating, laboratory photoreactor and examined by gas chromatography and mass spectrometry to determine the possible degradative effects of the ultraviolet component of sunlight. Irradiation of chlorinated biphenyls dispersed in water follwed by GC/MS, revealed identifiable traces of 2-chlorodibenzofuran as a photolysis product of 2,5-dichloro- and 2,2',5,5'-tetrachlorobiphenyl in roughly a 0.2 percent steady-state yield. Similar irradiation of 2,8-dichlorodibenzofuran also resulted in slow dehalogenation, explaining the previous appearance of 2-chlorodibenzofuran. The photodecomposition of the lower chlorinated PCB isomers in both polar and nonpolar solvents reveals the operation of environmental mechanisms which could effectively degrade these widespread contaminants. POSSIBLE MICROBIAL CONTRIBUTION TO NITROSAMINE FORMATION IN SEWAGE AND SOIL,
International Inst. of Tropical Agriculture, Ibadan (Nigeria).
A. Ayanaba, W. Verstraete, and M. Alexander.
J Natl Cancer Inst. Vol 50, No 3, p 811-813, 1973.
Identifiers: Fungicides, *Methylamines, *Microbial activity, Microorganisms, *Nitrosamines, *Sewage, Soils, *Thiram, Metabolism.

Microorganisms in sewage converted trimethylamine to dimethylamine (DMA) and also produced dimethylnitrosamine. DMA formation was solely the result of microbial activity. Most of the nitrosamine generated from added DMA and nitrite at neutral pH was a consequence of microbial metabolism. The nitrosamine also formed in acid soil from DMA and in acid sewage from the fungicide thiram. Although nitrosamines have not yet been found, or actively sought, in unamended sewage or soil, these findings indicate a potential for their formation in such environments.--Copyright 1973, Biological Abstracts, Inc.

THE POSSIBLE OCCURRENCE OF PHOTOSYNTHETIC MICROORGANISMS IN DEEP-SEA SEDIMENTS OF THE NORTH ATLANTIC,
City Coll., New York.
T. C. Malone, C. Garside, R. Anderson, and O. A. Roels.
Journal of Phycology, Vol 9, No 4, p 482-488, December 1973. 1 fig, 3 tab, 31 ref.

Descriptors: *Diatoms, *Marine microorganisms, *Bottom sediments, *Atlantic Ocean, *Deep water, Plant pigments, Photosynthesis, Plant growth, Bottom sampling, Water analysis, Chemical analysis, Soil analysis, Nitrates, Ammonia, Phosphates, Silicates, Silicon, Growth rates, Marine algae.
Identifiers: Growth kinetics, Cell density, Amphora, Nitzschia, Navicula, Fragilaria, Chlorophyll a, Sample preservation, Red clay.

An assemblage of 12 diatom species and other photosynthetic microorganisms associated with red clay sediments collected from a depth of 6150 m in the North Atlantic was observed to bloom in Antarctic bottom water when exposed to sunlight at sea surface temperature. Although no growth could be detected over the first 3 days of the experiment, nitrate was nearly completely stripped from the water. The maximum growth rate of 4.7 doublings/day was reached between days 1 and 5. Most of the diatom species have been described as littoral or coastal forms, and it is suggested that these organisms are transported to depth by fecal material, turbidity currents, or a combination of the two. PROPERTIES OF GB IN WATER,
Edgewood Arsenal, Aberdeen Proving Ground, Md.
J. Epstein.
Journal American Water Works Association, Vol 66, No 1, p 31-37, January 1974. 5 fig, 5 tab, 28 ref.

Descriptors: *Pollutant identification, Methodology, *Physical properties, *Chemical analysis, *Water treatment, Water pollution effects, *Water pollution, Hydrolysis, Bioassay, Toxicity, Solubility, Environmental effects, Water temperature, Hydrogen ion concentration, Chemical reactions, Toxins, Pollutants, Lethal limit, Trace elements, Heavy metals, Catalysts, Cations, Manganese, Copper, Magnesium, Density, Volatility, Vapor pressure, Water analysis, Activated carbon, Fish, Testing procedures.
Identifiers: *Nerve gas GB(Sarin), Half-life, Pollutant removal, Hydrolysis products, Median tolerance limit, Green sunfish, Fathead minnow, Goldfish, Enzymatic techniques, Isopropyl methylphosphonic acid, Hydrofluoric acid.

The purpose is to determine what practical measures can be taken to detect and minimize the effects of nerve gas contamination, specifically that of GB, should there be a need for such measures. GB or Sarin is liquid at room temperature, very soluble with rapid dissolution in water, and extremely toxic when inhaled or absorbed through the skin. Experiments on rats and rabbits have shown that this agent is not readily absorbed through the skin from aqueous solutions. Hydrolysis of GB in water yields isopropyl methylphosphonic acid and hydrofluric acid. The rate of hydrolysis is accelerated by both acids and bases, with the latter more effective. At 25C between pH values of 0 and 4, the hydrolysis is speeded by hydronium-ion catalysis; between pH 6.5 and 14, the hydrolysis is mediated by hydroxide-ion attack. In the intermediate pH range of 4-6.5, where the hydrolysis rate is at a minimum, the reaction is between GB and water molecules. The rate of hydrolysis of GB is markedly affected by the presence of some cations. Even trace amounts, in some cases, are sufficient to lower the half-life by two orders of magnitude. Since the rate of decomposition of GB is equal to the product of the bimolecular rate constant and the concentration of the hydroxocation, Cu and Mn will be more effective catalysts than Mg for the hydrolysis of GB. Those enzymatic, chemical, and bioassay procedures for the detection and analysis of GB in water are presented as well as treatment procedures for removing or destroying GB. (Holoman-Battelle)

THE FATE OF DIELDRIN IN A MODEL ECOSYSTEM,
Illinois State Natural History Survey, Urbana.
J. R. Sanborn, and Y. Ching-Chieh.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 6, p 340-346, December 1973. 6 tab, 2 ref.

Descriptors: *Dieldrin, *Ecosystmes, Persistence, Model studies, *Path of pollutants, *Biodegradation, *Pesticides residues, Radioactivity techniques, Metabolism, Stability, Absorption, Crabs, Clams, Daphnia, Separation techniques, Degradation(Decomposition), Algae, Mosquitoes, Snails, Pesticide kinetics.
Identifiers: *Fate of pollutants, Metabolites, Biological samples, Bioaccumulation, Acetone, Liquid scintillation, Scintillation counting, Degradation products.

A model ecosystem containing algae, clams, crabs, Daphnia, Elodea, mosquitoes, fish and snails was used to examine the persistence of dieldrin. Replicate systems were used with 7.905 mg C-14-labeled dieldrin as an acetone solution (0.5 ml) applied to sorghum leaves in each. Study of accumulation, metabilism, and degradation of the dieldrin continued for 34 days. The organisms were extracted with acetone and solubilized with Protosol for liquid scintillation counting. The examination of dieldrin in this model ecosystem clearly demonstrates the stability of this insecticide towards either biological or chemical modification by the elements of this system. The demonstration that approximately 97 percent of the extracted radioactivity in the organisms was dieldrin emphasizes the inertness of dieldrin to metabolism or degradation to polar, nonlipid partitioning materials by the components of this model ecosystem. If information about the stability and persistence of pesticides derived from this system can be related to a real environmental situation, and it definitely seems to be in the case of DDT, then the data of this paper indicate that dieldrin like DDT, might be considered, because of its extreme stability, an undesirable pesticide for widespread generalized use in agricultural and public health entomology. MOBILIZATION OF SOME METALS IN WATER AND ANIMAL TISSUE BY NTA, EDTA AND TPP,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
J. Barica, M. P. Stainton, and A. L. Hamilton.
Water Research, Vol. 7, No. 12, p 1791-1804, December 1973. 6 fig, 5 tab, 21 ref.

Descriptors: *Path of pollutants, *Alkaline earth metals, *Alkali metals, *Heavy metals, *Nitrilotriacetic acid, Crayfish, Midges, Rainbow trout, Bottom sediments, Detergents, Movement, Kinetics, Cations, Calcium, Magnesium, Sodium, Potassium, Iron, Manganese, Zinc, Copper, Lead, Chromium, Absorption, Lake sediments, Chemical analysis, Water analysis, Gas chromatography, Bioassay.
Identifiers: *Chelating agents, Animal tissues, Mobilization, *Ethylenediaminetetraacetic acid, Chironomids, Detergent builders, *Sodium tripolyphosphate, Flameless atomic absorption spectrophotometry, Metal chelates, Guppy, Chironomids, Detergent builders, Sample preparation, Emission spectroscopy, Atomic absorption spectrophotometry, Orchard leaves, Clay Lake.

Parallel experiments were conducted under stagnant and flowing conditions to determine whether sodium tripolyphosphate (TPP), the conventional detergent builder, or two potential replacements, nitrilotriacetic acid (NTA) and ethylenediaminetetraacetic acid (EDTA) significantly influenced the mobilization of major cations (Ca, Mg, Na, K) and some heavy metals (Fe, Mn, Zn, Cu, Pb, Cr). Water, sediments and tissues of chironomid adults (Chironomus tentans Fabricius), crayfish (Orconectes virilis Hagen) and rainbow trout (Salmo gairdneri Richardson) were examined. The results showed that the chelating agents applied in concentrations of 0.2-5.0 mg/l often increased the concentration of iron, manganese, lead and zinc in water above contaminated lake sediments. Other heavy metals were not affected significantly. EDTA was the most active mobilizing agent while NTA and TPP both had a less significant effect. The chelating agents generally had little effect on the rate of uptake of most metals by chironomids in aquaria. The role of chelating agents in flowing systems was even less pronounced. Zinc concentrations in water were significantly elevated by the treatment with 1 mg/l EDTA and manganese concentrations were significantly higher in trout from the pond treated with an intermediate level (1 mg/l) of NTA. All other treatments yielded levels of major ions and heavy metals that were not significantly different from those in the control ponds. (Holoman-Battelle)

ALLUVIAL GROUND WATER QUALITY ALTERATION AS RELATED TO SOLID WASTE DISPOSAL SITES IN IOWA, PART I: TEXT; PART II: APPENDIX,
Iowa State Univ., Ames. Dept. of Earth Sciences.
J. M. Peckenpaugh.
Available from the National Technical Information Service as PB-230 795 $25.75 in paper copy, $1.45 in microfiche. M Sc Thesis, 1973. 440 p, 58 fig, 29 tab, 47 ref, 5 append. OWRR A-047-IA (2).

Descriptors: *Path of pollutants, *Landfills, *Iowa, Garbage dumps, Water pollution sources, Municipal wastes, Seepage, *Waste disposal, Waste water disposal, *Solid wastes.

The effects solid waste disposal sites in and near Iowa located on alluvial systems have upon groundwater quality were studied at Ames, Des Moines, Mason City, and Omaha. The hydrogeologic study was pursued to satisfy four major objectives. The first was to determine the composition and variations in the composition of groundwater affected by leachate flowing from solid waste disposal sites. The second objective was to determine the shape of the contaminated zone of groundwater and the approximate direction and rate of groundwater flow in the vicinity of the landfills. A third objective was to evaluate the effects that precipitation and variations in stream discharge had upon the static water level, the composition of the groundwater, and groundwater movement in the vicinity in the landfills. The fourth was the development of general cases that could be applied to similar hydrogeologic environments. (Knapp-USGS)

WATER QUALITY REPORT--YAKIMA RIVER, DECEMBER 1970--SEPTEMBER 1971,
Washington State Dept. of Ecology, Olympia.
D. M. McGaughy, and R. K. Cunningham.
Technical Report No 73-002, May 1973. 87 p, 8 fig, 43 tab, 12 ref.

Descriptors: *Water quality, Rivers, *Washington, Monitoring, Sampling, *Coliforms, Nitrates, Water temperature, Sodium, Calcium, Return flow, Farm wastes, Water pollution sources, *Dissolved oxygen.
Identifiers: *Yakima River(Wash).

Data collected through the winter months reveal distinct pollution problems in the Yakima River, Washington. The most significant effect of pollution was the river's bacterial condition. Nutrients were high enough at many stations to support algal blooms under optimal growth conditions. The summer months held the most serious pollution problems for the year, revealing amplifications of problems observed in the previous quarters. All coliform values were in violation of both conditions of the water quality standard. Eight out of eleven stations surpassed the maximum temperature limit. Also, there appeared to be a dissolved oxygen sag between Yakima and Granger and between Prosser and Kiona. This dissolved oxygen reduction seems to be directly related to the oxidation of organic material and not increased temperature. Extremely high nitrate values existed at the principal areas of irrigation return water. At Terrace Heights, above the influence of irrigation, 81% of the cations were calcium and magnesium while downstream at Kiona only 57% of the cations were calcium and magnesium. This change was probably related to substantial amounts of sodium being washed from the soil as a result of agricultural activities. The water quality has remained virtually unchanged during the summer over the past 4 years. (Knapp-USGS)
W74-06261

EFFECTS OF WELL INJECTION ON A BASALTIC GHYBEN-HERZBERG AQUIFER,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
D. R. Hargis, and F. L. Peterson.
Ground water, Vol 12, No 1, p 4-9, January-February 1974. 7 fig, 4 ref. OWRR A-028-HI (2).

Descriptors: *Artificial recharge, *Injection wells, *Waste disposal wells, Basalts, *Hawaii, Groundwater movement, Storm runoff, Urban runoff, Aquifer testing.
Identifiers: Ghyben-Herzberg aquifers.

The practice of artificially recharging wastewater such as storm runoff, sewage effluent, and various industrial wastes into the subsurface is of growing importance in Hawaii. In 1970 construction of a collection basin and four deep injection wells for the disposal of storm runoff from a residential development began in Kahului, Maui. This presented an opportunity to evaluate the response of a basaltic Ghyben-Herzberg aquifer to well injection, and to measure the rate of movement of injected water in the aquifer. The results of pumping and injection tests of one completed well and one test hole indicate that the finished injection wells should be able to transmit sediment-free water at rates in excess of 5,500 gallons per minute per well. Observation well measurements indicate that injected water moves at a gross velocity of one foot per minute in the basalt aquifer in the vicinity of the injection wells. (Knapp-USGS)

NITRATE-NITROGEN AND PHOSPHORUS CONTENTS OF STREAMS DRAINING SMALL AGRICULTURAL WATERSHEDS IN KENTUCKY,
Kentucky Univ., Lexington. Dept. of Agronomy.
G. W. Thomas, and J. D. Crutchfield.
Journal of Environmental Quality, Vol 3, No 1, p 46-49, January-March 1974. 5 fig, 2 tab, 3 ref. OWRR A-024-KY (2).

Descriptors: *Nitrates, *Phosphorus, *Small watersheds, *Kentucky, *Land use, Fertilizers, Hydrogeology, Water pollution sources.

Eight streams draining agricultural watersheds representative of the important physiographic regions of Kentucky were sampled monthly from January through May in both 1971 and 1972. The objective was to determine the effects of land use and geology on the concentrations of nitrate-N and P in the stream water. The land use ranged from almost completely forested to mostly cultivated. There was no good relationship between nitrate-N and land use. Nitrate-N varied from 6 ppm to zero, with the highest value found in a stream draining a

watershed which was 98% in bluegrass pasture. The P concentrations in the stream water were closely related to local geology and not to land use. A comparison between the 1921 data and 1971-72 data from the same geological areas showed very little change in mean nitrate-N or P concentrations. (Knapp-USGS)
W74-06265

LOSS OF MERCURY(II) FROM SOLUTION,
Kansas State Univ., Manhattan. Dept. of Agronomy.
D. W. Newton, and R. Ellis, Jr.
Journal of Environmental Quality, Vol 3, No 1, p 20-23, January-March 1974. 6 tab, 14 ref. OWRR B-027-KANS (1).

Descriptors: *Mercury, *Water analysis, *Chemical analysis, Tracers, Aqueous solutions, Clay minerals, *Ion exchange, Oxidation, Reduction(Chemical), Chemical reactions.

Loss of mercury(II) from dilute solutions was studied using Hg-203 as a tracer. Magnitude and rate of loss depend on Hg(II) concentration, chemical composition of carrier solutions, and container material. Losses were severe only at Hg(II) concentrations of 0.2 ppm or lower. Of the Hg-containing solutions studied, loss was greatest from 0.01M CaC12; Hg(II) was stable at all levels in concentrated HN03. Increasing pH from 4 to 8 reduced Hg loss. Adding KMn04 also reduced losses. Glass and plastic containers differ in their ability to retain Hg(II) in solution. The problem of Hg loss has serious implications in analyses of Hg as an environmental contaminant and in research where low concentrations of Hg are used. (Knapp-USGS)

DISTRIBUTION OF RADIONUCLIDES IN THE COLUMBIA RIVER STREAMBED FROM THE NUCLEAR REACTORS, HANFORD RESERVATION TO LONGVIEW, WASHINGTON,
Geological Survey, Portland, Oreg.
W. L. Haushild, G. R. Dempster, Jr., and H. H. Stevens, Jr.
Open-file report, 1973. 73 p, 12 fig, 11 tab, 21 ref.

Descriptors: *Path of pollutants, *Water pollution sources, *Columbia River, *Radioactive wastes, Bottom sediments, Estuaries, Alluvial channels, Radioisotopes, Cooling water, Zinc, Chromium, Cobalt radioisotopes, Manganese.
Identifiers: Antimony, Scandium, Zirconium, Niobium, Ruthenium.

Until all the eight nuclear reactors that were cooled by once-through flow of water were shut down in 1971, their effluents were the main source of dissolved and particulate radionuclides in the Columbia River. The pattern of seasonal variation of radionuclide concentrations in surficial sediment of the Columbia River generally was independent of location, radionuclide species, and sediment composition. The variations were attributable to seasonal changes in concentrations of suspended-particulate and dissolved radionuclides at Pasco, Wash., and changes in hydrodynamic and sediment-transport characteristics of the river. Radionuclide concentrations were maximum during November-early January and late March-early May, and were minimum during June-July and late January-early March. The estimated mean amount of five radionuclides accumulated in the bed from the reactors, Hanford Reservation to Longview, Wash., in 1965, was 37,100 curies and consisted of 12,800 curies of zinc-65, 22,300 curies of chromium-51 and 2,000 curies of three radionuclides, which were cobalt-60, scandium-46, and manganese-54. The main source of particulate radionuclides discharged to the ocean during high-water discharges in June was the riverbed rather than the estuary bed. (Knapp-USGS)

BIONOMICS AND INTEGRATED CONTROL OF PLANT PARASITIC NEMATODES,
Agricultural Research Service, Beltsville, Md. Plant Science Research Div.
J. M. Good.
Journal of Environmental Quality, Vol 1, No 4, p 382-386, October-December, 1972. 1 tab, 41 ref.

Descriptors: *Nematodes, *Nematocides, Cultivation, Entomology, Microbiology, Soil microorganisms, Soil sterilants, Water pollution sources, *Parasitism, *Animal parasites, Biocontrol.
Identifiers: *Bionomics.

Establishment of an agroecosystem promotes the rapid increase of endemic pathogenic species and allows introduction of nonendemic species that quickly establish dominance. Nematodes now cause about 10% loss of yields of crops in the United States. About 20 highly effective nematicides are available to control nematodes and associated plant diseases in a number of crops. Nematode populations can be regulated by a number of soil management practices, including clean transplant, seed production, and crop rotations. Biological control can be achieved by addition of various types of organic matter to soil, some of which are not presently utilized, especially biodegradable solid wastes. Over 152 nematode-resistant crop varieties representing 17 major crops are available with resistance from one to three species of the 10 most destructive nematode types. Physical methods of control, including quarantine, sanitation, and crop destruction, are not vigorously applied. (Skogerboe-Colorado State)

NITROGEN TRACERS IN NITROGEN CYCLE STUDIES -- PAST USE AND FUTURE NEEDS,
Tennessee Valley Authority, Muscle Shoals, Ala. Div. of Agricultural Development.
R. D. Hauck.
Journal of Environmental Quality, Vol 2, No 3, p 317-327, July-September, 1973. 2 tab, 56 ref.

Descriptors: *Nitrogen cycle, *Nitrogen compounds, Nitrogen fixation, Radioisotopes, Nutrient removal, Leaching, Water pollution sources, *Nitrates, Tracers, Ecosystems, Path of pollutants.

To achieve N balance in productive ecosystems, better quantitative estimates of N transformation rates are needed. Nitrogen tracers are indispensable for making many of these estimates. Either N15-enriched materials can be used. The use of N15-depleted materials is limited to studies where dilution from other N is less than 2,000-fold, but these materials are potentially available in ton amounts. Use of variations in natural N15 abundance may be useful in observing qualitative relationships among N cycle processes over large areas or extremely long time periods. Such use is questionable for obtaining quantitative information for short-term N transformation processes. Obvious information gaps are quantitative data on atmospheric N2 fixation and denitrification in cropped field soils and N transformation data for many other ecosystems. A program for computer data retrieval and correlation is outlined. (Skogerboe-Colorado State)
W74-06339

NITROGEN AND PHOSPHORUS COMPOSITION OF SURFACE RUNOFF AS AFFECTED BY TILLAGE METHOD,
Agricultural Research Service, Lafayette, Ind.
M. J. M. Romkens, D. W. Nelson, and J. V. Mannering.
Journal of Environmental Quality, Vol 2, No 2, p 292-295, April-June, 1973. 2 fig, 4 tab, 12 ref.

Descriptors: *Nitrogen, *Phosphorus, *Leaching, Nutrient removal, *Cultivation, Soil management, Fertilizers, Pollutants, Erosion, Sediments.

The effect of tillage methods on the nitrogen and phosphorus composition in runoff water and runoff sediment from corn plots was studied on Bedford silt loam soil by applying simulated rainstorms. Five tillage-planting systems were compared: coulter-plant, till-plant, chisel-plant, disk and coulter-plant, and conventional-plant. The coulter and chisel systems controlled soil loss, but runoff water contained high levels of soluble nitrogen and phosphorus from surface-applied fertilizer. The disk and till systems were less effective in controlling soil erosion, but had lower concentrations of soluble nitrogen and phosphorus in runoff water. Conventional tillage, in which fertilizers were plowed under, had the highest losses of soil and water but small losses of soluble nitrogen and phosphorus. However, high percentages of the total nutrients removed by runoff were components of the sediment from all treatments. (Skogerboe-Colorado State)

NITROGEN LOSSES IN SURFACE RUNOFF FROM AGRICULTURAL WATERSHEDS ON MISSOURI VALLEY LOESS,
Agricultural Research Service, Lincoln, Nebr.
G. E. Schuman, R. E. Burwell, R. F. Piest, and R. G. Spomer.
Journal of Environmental Quality, Vol 2, No 2, p 299-302, April-June, 1973. 5 tab, 15 ref.

Descriptors: *Nitrogen, *Leaching, *Nutrient removal, Solubility, Pollutants, Soil chemistry, Dispersion, Fertilizers, Sediments, Erosion, *Iowa, *Missouri River, Watersheds(Basins).

Nitrogen losses from surface runoff from four field-size (30 to 60-8 ha) watersheds in southwestern Iowa, near Treynor, were measured during 1969, 1970, and 1971. A contour-planted corn watershed and a pasture watershed were fertilized at the recommended N rate (168 kg/ha). A level-terraced and a contour-planted corn watershed were fertilized at 2.5 times this rate. The conservation practice of level-terraced corn or pasture was very effective in reducing water, sediment, and N yields when compared with the contour-planted corn watersheds. Annual water-soluble N losses were low from all watersheds. The three-year average annual solution N loss from the contour-planted corn watershed, fertilized at 2.5 times the recommended rate, was 3.05 kg/ha; the comparable watershed, fertilized at the recommended rate, lost only 1.89 kg/ha. (Skogerboe-Colorado State)

LONG-TERM EFFECTS OF MANURE, FERTILIZER, AND PLOW DEPTH ON CHEMICAL PROPERTIES OF SOILS AND NUTRIENT MOVEMENT IN A MONOCULTURE CORN SYSTEM,
Michigan State Univ., East Lansing. Dept. of Crop and Soil Sciences.
M. L. Vitosh, J. F. Davis, and B. D. Knezek.
Journal of Environmental Quality, Vol 2, No 2, p 296-299, April-June, 1973. 5 tab, 20 ref.

Descriptors: *Farm wastes, *Fertilizers, Solid wastes, *Organic matter, *Nutrient removal, *Soil chemical properties, Corn(Field).

An evaluation of soil chemical properties, organic matter and nutrient accumulations, and nutrient movement and recovery after 6 and 9 years of annual fertilizer and manure applications to continuous corn was conducted on two soil types. Plow depths of 18 versus 30 cm had little or no effect on soil test values or nutrient accumulation patterns in the surface of a Conover-Hodunk loam soil. The pH value of both soils decreased slightly more than 0.1 pH unit per year with the annual application of 168 kg of N/ha as ammonium sulfate. The most favorable rate of manure for the Metea sandy loam soil was 22.4 metric tons/ha (10 tons/acre). Larger applications caused a significant buildup of exchangeable K in the surface and subsurface horizons and resulted in inefficient use of all nutrients. The K buildup was less critical on the loam soil or where silage rather than grain was removed. (Skogerboe-Colorado State)
W74-06346

NITROGEN-15 ENRICHMENT OF SOILS AND SOIL-DERIVED NITRATE,
Iowa State Univ., Ames. Dept. of Agronomy.
J. M. Bremner, and M. A. Tabatabai.
Journal of Environmental Quality, Vol 2, No 3, p 363-365, July-September, 1973. 3 tab, 12 ref.

Descriptors: *Nitrates, *Nitrogen, Leaching, Nutrient removal, Water pollution sources, *Radioisotopes.
Identifiers: *Nitrogen-15, Soil-derived nitrate.

Nitrogen-isotope analysis of soils and soil-derived nitrate showed that there is considerable variation in the N15 enrichment of the nitrate nitrogen produced on aerobic incubation of different soils and that the N15-enrichment of this nitrate nitrogen depends upon the time of incubation and can differ markedly from that of the total soil N. The data reported illustrate the impracticability of a recently proposed method of assessing the contribution of fertilizers to nitrate in surface waters that requires measurement of the natural N15 enrichment of soil- and fertilizer-derived nitrate. CHEMICAL POLLUTION OF GROUND WATERS,
W. J. Kaufman.
Journal of the American Water Works Association, Vol 66, No 3, p 152-159, March 1974. 8 fig, 6 tab, 21 ref.

Descriptors: *Water pollution sources, *Path of pollutants, Groundwater, Nitrates, Heavy metals, *Detergents, *Nitrogen, Water quality, Oily water, *Gasoline, *Trace elements, Oil pollution, *Pesticides.

Contamination of groundwater has become a problem in some areas. Among the contaminants are pesticides, trace elements, and nitrate-nitrogen. A frequently encountered pollutant is petroleum products, especially gasoline. Generally, this problem is one of metropolitan areas and is localized around a point source. Municipal wastewater reclamation operations involving spread or injection have been responsible for detergent pollution of groundwaters, which, of course, raises questions regarding a variety of other industrial pollutants that may be present in municipal wastes and resist removal or degradation by the treatment processes normally employed. WATER QUALITY AND OTHER ASPECTS OF GROUND-WATER RECHARGE IN SOUTHERN CALIFORNIA,
Toups Engineering, Inc, Santa Ana, Calif.
J. M. Toups.
Journal of the American Water Works Association, Vol 66, No 3, p 149-151, March 1974. 2 tab.

Descriptors: *Artificial recharge, *California, *Water quality, *Groundwater, *Water pollution sources, *Path of pollutants, Water management(Applied), Saline water intrusion.

Groundwater recharge became necessary in southern California during the 1950's because groundwater levels along the coastline had dropped below sea level in many places and seawater was intruding into the groundwater basins. Most of the recharge water is Colorado River water, which is of poorer quality than native groundwater or local streamflow. Recharge water, whether it be placed underground by spreading or by injection, can undergo water-quality changes through interaction with the soil. The changes are dependent upon the specific character of the recharge water and upon the soil type. (Knapp-USGS)

NITRATES AND GROUND-WATER MANAGEMENT IN THE FRESNO URBAN AREA,
K. D. Schmidt.
Journal of the American Water Works Association, Vol 66, No 3, p 146-148, March 1974. 2 fig, 6 ref.

Descriptors: *Groundwater, *Nitrates, *Water quality, *California, Water pollution sources, Urbanization, Septic tanks, Fertilizers, Waste water disposal, Sewage treatment.
Identifiers: *Fresno(Calif), Clovis(Calif).

The distribution of nitrate in groundwater of the Fresno-Clovis Metropolitan Area, California, is discussed. The natural quality of groundwater is excellent, but manmade disposal of high-nitrogen wastes in the urban area pose a potential pollution problem. Nitrates exceeding 45 ppm have been found in samples from wells in unsewered urban areas, near sewage-effluent percolation ponds, and near wineries on independent disposal systems. Natural nitrate concentrations appear to be less than 7 ppm in most urban-area groundwaters. Twelve wells had nitrate contents exceeding 45 ppm in 1970. Four of these wells were near the Fresno sewage-treatment plant, four were near the Clovis sewage-treatment plant, and two were near a winery. The primary sources of nitrate are sewage effluent, septic-tank effluent, wineries, meat-packing plants, and agricultural fertilizers. Little downgradient movement of contaminated groundwater occurs except near the Fresno sewage-treatment plant. Disposal of storm-runoff wastewater has not affected groundwater quality to any noticeable extent. (Knapp-USGS)

PROBLEMS OF WATER-QUALITY STANDARDS IN THE MANAGEMENT OF GROUND-WATER BASINS,
Pomeroy, Johnston and Bailey, Pasadena, Calif.
R. D. Pomeroy.
Journal of the American Water Works Association, Vol 66, No 3, p 143-146, March 1974. 1 fig, 1 ref.

Descriptors: *Water quality standards, *Groundwater, Water management(Applied), Solutes, *Electrical conductance, Nitrates, Carbonates, Salinity, Sodium, *Alkalinity.

Hardness, total dissolved salts, and alkali factor provide a fairly complete picture of groundwater quality with respect to major constituents, but many minor constituents need to be measured for the establishment of logical regulations. Electrical conductivity is very useful, correlating better with such properties as osmotic pressure than does TDS. Where water is used for irrigated agriculture, an important characteristic of the water is the alkali factor. This factor is an indicator of the effects on soil clays exerted by the residual soil solution after evaporation of a major part of the water. (Knapp-USGS)

WATER QUALITY REPORT, UPPER SNOQUALMIE RIVER SYSTEM, AUGUST 1972-NOVEMBER 1972,
Washington State Dept. of Ecology, Olympia.
P. Lee.
Technical Report No 73-004, February 1973. 14 p, 1 fig, 2 tab, 5 ref.

Descriptors: *Water quality, Rivers, *Washington, *Sampling, Nutrients, Chlorides,

Turbidity, Streamflow, Water temperature, Hydrogen ion concentration, Specific conductivity, Dissolved oxygen.
Identifiers: *Snoqualmie River(Wash).

Water samples were collected from stations established on the North, Middle, and South forks of the Snoqualmie River. The dissolved oxygen levels remained consistently high with the saturation rarely falling below 90%. River temperatures were mostly normal except on hot days when relatively high temperatures were found in the shallow, slow moving portions of the system. The pH values ranged from 6.7 to 7.7 with the higher values occurring at low flows. Chlorides remained at low concentrations. Conductivity levels are consistent with other freshwater rivers in the State and vary inversely with the river flow. Turbidity remained at minimal detection levels except following periods of rain. There is a constant nutrient load to the system throughout the year. The load is diluted by rain and surface runoff during periods other than the low flow season. (Knapp-USGS)

WATER QUALITY SIMULATION AND APPLICATION,
Environmental Research and Technology, Inc., Lexington, Mass.
P. S. Lombardo, and R. F. Ott.
Water Resources Bulletin, Vol 10, No 1, p 1-9, February 1974. 5 fig, 10 ref.

Descriptors: Water resources development, *Management, *Long-range planning, *Water quality, *Simulation analysis, *Optimum development plans, River basins, Water utilization, *Washington, Biochemical oxygen demand, Dissolved solids, Climatic data, Hydrologic data, Mathematical models, Systems analysis, Evaluation, Equations.
Identifiers: *Seattle(Wash.), Cedar River basin, Green River basin, Mass balance equation, Coliform dieaway, BOD decay.

An understanding of the causes of aquatic system behavior leading to proper system management is enhanced by knowledge obtained through water quality modeling. For accurate assessment of the quality of a water body, the dynamic and synergistic character of the aquatic environment necessitates knowing the temporal and spatial varying behavior of various water quality indices. Through mathematical formulations of the physical, biological and chemical processes occurring in the aquatic ecosystem, water quality models attempt to simulate the spatial and temporal variations in water quality indices. Described in detail is the Hydrocomp Water Quality Simulation Model and its application to the Seattle metropolitan area. Model input includes rate of coliform dieaway and BOD decay and climatological and hydrologic data; determination of total dissolved solids is done predominantly by a mass balance equation. The Seattle study searches for a plan to ensure the best utilization of the total water resources available to the Cedar and Green River basins, and includes evaluation of interbasin transfer. The Model provides a means for evaluating management policies in terms of the water quality indices. Through information generated on the probable resulting effects of policies, optimization of the various alternatives could be achieved. (Bell-Cornell)

OIL AND GAS SEEPS OF THE NORTHERN GULF OF ALASKA,
Alaska Univ., College. Inst. of Marine Science.
D. H. Rosenberg.
In: A Review of the Oceanography and Renewable Resources of the Northern Gulf of Alaska: Alaska University Institute of Marine Science Report R72-23 (Sea Grant Report 73-3), Section 6, p 143-148, February 1972. 2 fig, 9 ref. NOAA Grant 04-3-158-41.

Descriptors: *Oil spills, *Pacific Ocean, Water pollution sources, Reviews, Oil fields, *Oil pollution, Oily water.
Identifiers: *Gulf of Alaska, *Oil and gas seeps.

None of the published reported oil and gas seeps in the Gulf of Alaska are known to issue directly into the sea, with the exception of one of the Katalla region which issues at the higher high-water line. However, many of the known seeps occur in streambeds that eventually drain into the Gulf of Alaska; therefore, a large quantity of oil has and still is drained into marine waters. The most likely area for finding such a seep is in the area of Katalla, as those seeps reported near Yakataga are all one or more miles inland. (See also W74-06426) (Knapp-USGS)

WATER QUALITY EFFECTS OF SEEPAGE FROM EARTHEN DAMS,
Geological Survey, Prescott, Ariz.
C. Yost, Jr., and J. W. Naney.
Journal of Hydrology, Vol 21, p 15-26, January 1974. 3 fig, 2 tab, 4 ref.

Descriptors: *Seepage, Surface waters, *Floodwater, *Structures, Impounded waters, *Salinity, Aqueous solutions, Geologic formation, Chemicals, Solubility, Mud, *Oklahoma, Earth dams, *Water quality.
Identifiers: Depletion, *Concentration, Chemical activities.

Analyses of surface and seepage waters from selected floodwater retarding structures in west-central Oklahoma show the salinity of seepage to be several times greater than that of the impounded waters. The increases in concentration of the several chemical components are not proportional. This phenomenon appears to be caused largely by simple solution, which is closely related to the chemical character of the geologic formation that provides the reservoir site and the earth fill of the dam. Concentration of certain chemical components in the seepage water progressively decreases as the structure ages. This is probably a function of depletion, which is related to the amounts and solubility of the parent materials subjected to solution. In contrast, the concentration of certain other components, such as iron and calcium, increases with time. The chemical activities within the accumulating mud on the bottom of the reservoir apparently cause these increases.

5C. Effects Of Pollution

NITROGEN BUDGET OF A NORTH CAROLINA ESTUARY,
North Carolina State Univ., Raleigh. Dept. of Zoology.
W. G. Harrison, and J. E. Hobbie.
Available from the National Technical Information Service as PB-230 382, $5.50 in paper copy, $1.45 in microfiche. Water Resources Research Institute of the University of North Carolina, Report UNC-WRRI No 74-86, January 1974. 172 p, 32 fig, 26 tab, 93 ref, 4 append. OWRR B-052-NC (1), 14-31-0001-3917.

Descriptors: *Nitrogen, *Ammonium, *Nutrients, Mass, *Urea, Estuaries, Eutrophication, *Nutrient cycle, Nitrates, Absorption, *North Carolina.
Identifiers: *Pamlico River estuary(No. Car).

Nitrogen concentrations in the Pamlico River estuary changed seasonally with highs occurring in winter and early spring and lows occurring in summer. Of the five forms of nitrogen measured (nitrite, nitrate, ammonium, dissolved organic and particulate nitrogen), the dissolved organic fraction was the largest. Concentrations of total inorganic nitrogen varied over distance and over time basically reflecting nitrate fluctuations. Seasonal peaks in nitrite and nitrate concentrations occurred in winter with concentrations at barely detectable levels in summer. Concentrations were consistently higher upstream and were reduced to low levels near the mouth of the estuary during all seasons. Ammonium was present in relatively high concentrations year round and was distributed uniformly throughout the estuary. Dissolved organic nitrogen concentrations were at least equivalent to inorganic nitrogen concentrations most of the year. Biological uptake and release were the most important pathways of nitrogen transformation. The calculated annual inorganic nitrogen budget for the estuary revealed that of the total inorganic nitrogen entering the system, nearly 40% disappeared. The predominant form in the tributary inputs was nitrate, which was reduced to nearly undetectable concentrations before leaving the estuary; nitrite followed a similar pattern. In contrast, ammonium concentrations in inflowing waters increased. At present, nitrogen appears to be a major factor limiting the production of the estuary although the amounts entering have caused no noticeable ill effects. (McJunkin-North Carolina)
W74-05954

THE EFFECT OF STRESS AND NON-STRESS CONDITIONS UPON THE INTERACTION OF PLECTONEMA BORYANUM AND THE LPP-PHYCOVIRUSES,
Delaware Univ., Newark. Dept. of Biological Sciences.
R. E. Cannon.
Available from the National Technical Information Service as PB-230 456, $5.50 in paper copy, $1.45 in microfiche. Ph D Thesis, June 1973. 40 p, 4 fig, 2 tab, 19 ref. OWRR A-016-DEL (4).

Descriptors: *Algae, *Plant viruses, Water pollution effects, Aquatic microbiology, Aquatic microorganisms, Plant pathology, *Cyanophyta.
Identifiers: *Algae-virus interactions, *Plectonema boryanum.

Lysogeny was established in Plectonema boryanum, a filamentous blue-green alga, by LPP-1D and LPP-2 phycoviruses after treatment of the alga with antibiotics, heavy metal, and nutrient limitation. Mitomycin C induction and viral neutralization confirm lysogeny. Infection of antibiotic treated cells by LPP-1 virus failed to establish lysogeny, indicating that LPP-1 is a virulent phycovirus while LPP-1D and LPP-2 were found to be temperate viruses. Continuous culture techniques were also used to study long-term population interactions of Plectonema and the LPP-viruses. After LPP-1 infection of sensitive algae, three oscillations occur in cell density with concomitant increases in virus before final stabilization of both algal and phycoviral populations. After LPP-1D and LPP-2 infection, only one fall in cell density occurs with a burst of virus particles. Resistant algae always repopulated; lysogeny was never established in chemostat experiments. SUCCESSION IN BENTHIC MACROFAUNA IN A SWEDISH FJORD SUBSEQUENT TO THE CLOSURE OF A SULPHITE PULP MILL,
Swedish Water and Air Pollution Research Lab., Gotenborg.
R. Rosenberg.
OIKOS, Vol 24, No 2, p 244-258, 1973. 14 fig, 1 tab, 41 ref.

Descriptors: *Pulp wastes, *Sulfites, *Biological communities, *Succession, Statistical methods, Growth rates, Population, *Fjords, Benthic fauna, Water pollution effects, Water quality control, Sampling, Mollusks, Dominant organisms, Distribution patterns, Crustaceans.
Identifiers: Species diversity, *Repopulation, Polychaetes, Echinoderms, Recovery, Anthozoa, Phoronids, Diversity index, *Sweden(Saltkallefjord).

Quantitative sampling of the fauna in a Swedish fjord was made in 1971 and 1972 to complement previous data about the faunal recovery after the cessation of the sulphite pulp mill in 1966. In 1972 the succession had approached a final phase in which the fauna had regained a composition similar to that found forty years earlier. The benthic faunal increment, expressed as dry weight, in Saltkallefjord over the period 1968-71 was roughly estimated to 20 percent and the yearly production to 70-80 tons on this 4.4 sq km area. Different indices have been used to describe the communities and the diversity. The succession showed a logistic pattern similar to population growth curves. (Mortland-Battelle)

Identifiers: Oscillatoria agardhii, Aphanizomenon flos-aquae, Sample preparation, Data interpretation, Enrichment, Orthophosphates, *Sweden(Lake Malaren), *Sweden(Stockholm archipelago).

Eighteen surface water samples were collected during 1970 from Lake Malaren (freshwater) and to the outer part of the Stockholm Archipelago (brackish water). After filtration most samples were enriched with phosphate (P), nitrate (N) and chelated trace elements (TE), alone or in combination, and inoculated with blue-green algae, Oscillatoria agardhii or Aphanizomenon flos-aquae, isolated from the investigated area. The algae (not free from bacteria) were cultivated under standard conditions. The dry weight at harvesting was used to evaluate the growth-stimulating effect (in comparison with unenriched controls) of the additions. The yields of O. Agardhii (the controls and those with all three additions) were largest 17-26 km to the east of Slussen, the Stockholm lock. During the year the smallest growth occurred during summer. The results with A. flos-aquae followed a similar distribution pattern. Regression analysis of the results with O. Agardhii showed that enrichment with TE or P, along or together, did not stimulate growth. The addition of N, alone and in combinations with TE or P, stimulated the growth, in proportion to the growth in the unenriched water samples. The enrichment with P plus N plus TE gave the largest stimulation. (Mortland-Battelle)

RELATIONSHIPS BETWEEN LEVELS OF RADIOCESIUM IN DOMINANT PLANTS AND ARTHROPODS IN A CONTAMINATED STREAMBED COMMUNITY,
Savannah River Ecology Lab., Aiken, S.C.
G. E. Anderson, J. B. Gentry, and M. H. Smith.
OIKOS, Vol 24, No 2, p 165-170, 1973. 4 tab, 27 ref.

Descriptors: *Cesium, *Radioactive wastes, *Food webs, Flood plains, Vegetation, *Path of pollutants, Nuclear reactors, Radioisotopes, Streams, Insects, Statistical methods, Ecosystems, Regression analysis, Islands, Cooling water, Water pollution effects, Correlation analysis, *South Carolina.
Identifiers: *Arthropods, Sample preservation, Cesium radioisotopes, Scintillation counting, Broomsedge, Grasshoppers, Spiders, Leafhoppers, *Steel Creek(S.Car.).

For several years Steel Creek (South Carolina) received reactor cooling water and dissassembly basin effluents from two nuclear production reactors located near the stream's headwaters. When the stream no longer received reactor effluent in 1968, water flow was reduced and portions of the old streambed became exposed. Contaminated vegetation then became available to animals as food. Thus, a unique opportunity was created to study the fate of radionuclides in a natural system. Preliminary study of the Steel Creek system was an investigation into the radiocesium levels and concentration ratios of a plant-herbivore-predator food web. Emphasis has been to develop predictive models for radiocesium concentrations in the system. Samples of vegetation and arthropods were collected, analyzed for radiocesium by scintillation counting, and the results statistically analyzed to determine whether any relationship existed between radioisotope concentrations. Mean cesium concentrations were significantly higher on the islands than on floodplain areas. There were no consistent trends for increasing or decreasing concentration across trophic levels. However, the degree of linear correlation between radiocesium concentrations in different types of plants and arthropods was significant and makes possible a model to predict radiocesium levels in other components of the system. Predictability was highest between the various arthropod groups and lowest among the different plant types. Between the two possible producer-herbivore-predator associations (broomsedge-grasshopper-spider, and broomsedge-leafhopper-spider) radiocesium concentrations ratios differed significantly. (Mortland-Battelle)

NITROGEN AND PHOSPHORUS RELEASE FROM DECAYING WATER MILFOIL,
Wisconsin Univ., Madison. Dept. of Soil Science.
D. S. Nichols, and D. R. Keeney.
Hydrobiologia, Vol 42, No 4, p 509-525, September 28, 1973. 9 fig, 29 ref.

Descriptors: *Nitrogen, *Phosphorus, *Herbicides, *Carbon, Hydrogen ion concetration, Analytical techniques, Aquatic weeds, *Degradation(Decomposition), Sediments, Aeration, Biomass, Oxygen, Laboratory tests, Vegetation, Nitrites, Nitrates, Phosphates, Water analysis, Organic compounds, Nutrients, Water pollution sources, Organic matter.
Identifiers: *Water milfoil, Endothal, Organic carbon, Fate of pollutants.

To evaluate the net N and P contribution to water from herbicide-killed aquatic weeds, water milfoil containing 1.5 percent N and 0.30 percent P was killed with endothal and allowed to decompose, in the dark, in water only or sediment-water systems. Changes with time in dry weight, total N and P, and organic C in the plant material, and organic and inorganic forms of N and P in the water were determined. Plant decomposition was limited by N. Inorganic N was released by the sediment, and decomposition was more rapid when sediment was present. A smaller N requirement for decomposition under conditions of low 02 was postulated as a possible explanation of the more rapid decomposition observed in the absence of aeration. The presence of plant P in excess of decomposition requirements resulted in rapid accumulation of organic P, followed by inorganic P, in the water. Organic N appeared in the water early in the experiments, but was depleted rapidly, and inorganic N was apparently immobilized as soon as it was formed. In the presence of sediment, organic N and inorganic P levels were much lower. On treating of water milfoil with herbicide, rapid P release can be expected. It would appear that N release from decaying weeds is much slower than P. (Mortland-Battelle)

THE OXYGEN CONSUMPTION OF MAYFLY (EPHEMEROPTERA) AND STONEFLY (PLECOPTERA) LARVAE AT DIFFERENT OXYGEN CONCENTRATION,
Uppsala Univ., (Sweden). Inst. of Zoophysiology.
B. Nagell.
Hydrobiologia, Vol 42, No 4, p 461-489, September 28, 1973. 12 fig, 32 ref.

Descriptors: *Respiration, *Stoneflies, *Mayflies, Larvae, Metabolism, Water pollution effects, Behavior, Calcium, Temperature, Osmotic pressure, Ecosystems, Oxygen, Bioassay, Ecology, *Oxygen demand, Movement, *Aquatic insects.
Identifiers: *Oxygen consumption, Motor activity, Macroinvertebrates.

The aim of this investigation was to elucidate how four aquatic insect larvae, from different habitats and having different respiratory organs or types of respiratory regulation, react to a lowered oxygen concentration, and how their oxygen consumption is affected. The species investigated where the stoneflies Taeniopteryx nebulosa, Diura nanseni and Nemoura cinerea and the mayfly Cloeon dipterum. Water of known oxygen concentration was allowed to flow past the experimental larvae. The oxygen consumption of the larvae was calculated from the lowering of the oxygen concentration which ensued. The critical point on the curve representing mean oxygen consumption as a function of oxygen concentration was found to be a 4-5 mg 02/1 for Nemoura. The values refer to 8 C. No influence on the oxygen consumption of starvation for 4 to 5 days was found. No difference between the oxygen consumption values obtained in the presence or in the absence of calcium ions could be observed during the experiments. The basic picture obtained is a set of oxygen consumption values scattered between a curve connecting highest values obtained and a curve of the standard metabolism together with a zone in which the larvae are activated by reduced oxygen concentrations. (Mortland-Battelle)
W74-06019

SELF-PURIFICATION AND CILIATE COLONIZATION IN ACID ENVIRONMENT (MODEL EXPERIMENT), (SELBSTREINIGUNG UND CILIATENBESIEDLUNG IN SAUREM MILIEU (MODELLVERSUCHE),
Bonn Univ. (West Germany). Institut fuer Landwirtschaftliche Zoologie und Bienenkunde.
H. Bick, and E. F. Drews.
Hydrobiologia, Vol 42, No 4, p 393-402, September 28, 1973. 4 fig, 2 tab, 7 ref.

Descriptors: *Acidity, *Bacteria, *Protozoa, Freshwater, Lakes, Rivers, Air pollution effects, *Peptides, *Degradation(Decomposition), Hydrogen ion concentration, Nitrification, Ammonia, Bioassay, Population, Resistance, Water pollution effects, Oxidation, Cultures, Lethal limit, *Self-purification.
Identifiers: *Peptone decomposition.

Because acid precipitation originating from air pollution may increase the acidity of lakes and rivers, a study was conducted of the effects of acidification on the population dynamics of bacteria and protozoa associated with the decomposition of peptone. Increasing acidification with sulfuric acid caused reduced rate of decomposition and nitrification. Below pH 5 no oxidation of ammonia took place. Total counts of bacteria and ciliates as well as number of species of ciliated Protozoa decreased slowly within the pH-range 7 to 5, but rapidly at pH-values 5 to 3. The limits of tolerance to high hydrogen ion concentration are summarized for 29 species of freshwater ciliates. (Mortland-Battelle)

2, 4, 5-T,
Phytox Corp., College Station, Tex.
F. S. Davis.
In: Water-1972, AIChE Symposium Series No 129, Vol 69, 1973, p 269-278. 55 ref.

Descriptors: *2 4 5-T, *Pesticide toxicity, *Environmental effects, *Reviews, Persistence, Plant metabolism, Movement, 2 4-D, Degradation(Decomposition), Bacteria, Domestic animals, Public health, Laboratory animals, *Herbicides.
Identifiers: Biological magnification, Fate of pollutants, Carcinogenicity, Tumorigenicity, Teratogenicity.

Available literature on 2, 4, 5-T and other chlorophenoxy herbicides was reviewed to assess the effect of these pesticides on the environment. Studies of toxicity, carcinogenicity, tumorigenicity, and teratogenicity indicate that they do not pose any undue threat when used properly. The bulk of the evidence gathered to date suggests that the chlorophenoxy herbicides dissipate rapidly from soils where they serve as a carbon source for the microbial population. Plants metabolize or complex the compounds readily. If domestic animals or wildlife ingest forage containing these herbicides, the chemicals are largely excreted via the urine. The possibilities of biological magnification seem remote. In general, the net effect on the environment has been reflected in increased yields of desirable species for man's use. (Little-Battelle)

OXYGEN CONSUMPTION OF LIMNOCALANUS MACRURUS SARS (CALANOIDA, COPEPODA) IN RELATION TO ENVIRONMENTAL CONDITIONS,
Guelph Univ. (Ontario). Dept. of Zoology.
J. C. Roff.
Canadian Journal of Zoology, Vol 51, No 8, p 877-885, August 1973. 5 fig, 1 tab, 28 ref.

Descriptors: *Copepods, Oxygen, *Respiration, *Water temperature, Lakes, Arctic, Population, Density, Lethal limit, Distribution patterns, Depth, *Canada, Seasonal, Oxygen demand, Heat resistance, Environmental effects.
Identifiers: Macroinvertebrates, *Oxygen consumption, *Arctic lakes, *Char Lake(N.W.T), Limnocalanus marcurus.

The oxygen consumption of Limnocalanus macrurus and its relationship to a number of environmental parameters were determined on specimens from two arctic lakes, both in the laboratory and in situ. The Q10 from O to 10C was 1.93 and from 5 to 15C was 2.20. The respiration rate increased shortly after capture of the animals and then declined to steady levels within 6 hr after capture. Experimental population densities within the range of 0.1 to 2 animals/ml had no effect on the adult respiration rate nor did the volume of the respiratory container. Experiments carried out in situ showed no relationship between depth of incubation and respiration rate, and did not differ significantly from the laboratory respiration rates. The upper lethal temperature was about 18C but animals could briefly withstand exposure to 21C. Lethal oxygen concentration was dependent on temperature, being about 0.8 mg/liter at O C. The relationship of these lethal levels to the distribution of the species is discussed. (Mortland-Battelle)

UPTAKE AND ACCUMULATION OF AN ORGANOCHLORINE INSECTICIDE (DIELDRIN) BY AN ESTUARINE MOLLUSC, RANGIA CUNEATA,
Texas A and M Univ., College Station. Dept. of Biology.
S. R. Petrocelli, A. R. Hanks, and J. Anderson.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 5, p 315-320, November 1973. 5 fig, 11 ref.

Descriptors: *Dieldrin, *Mollusks, *Bioassay, Absorption, Kinetics, Pesticide residues, Estuaries, Gas chromatography, *Texas, Water analysis, Path of pollutants, *Insecticides.
Identifiers: Bioaccumulation, Biological magnification, *Gas liquid chromatography, *Rangia cuneata, Sample preservation, Sample preparation, Cleanup, Biological samples, Macroinvertebrates, *Trinity Bay(Tex).

Clams (Rangia cuneata) were collected from Trinity Bay in Texas to study uptake and accumulation of dieldrin from dilute solution. The clams were acclimated for 1 to 2 weeks in holding tanks at 25C, 8.2 pH, and 15.6 percent salinity. They were then transferred to experiment tanks with water having like properties and a dieldrin concentration maintained at about 0.55 microgram/liter. Samples of clams and water were removed after 12, 24, 36, 48, 60, and 72 hours and after freezing and cleanup of the meat samples were analyzed for pesticide residue by gas-liquid chromatography. The results indicated that Rangia is capable of absorbing and concentrating dieldrin in its tissue to levels far above ambient. The smallest dieldrin residue in experimental clams was 38.2 micrograms/liter after 12 hours exposure and the largest 1226 micrograms/liter after 60 hours. Apparently the dieldrin is not noxious enough in the concentration used to affect siphoning and thus it is accumulated in quantities that may become a threat to the estuarine food web. (Mortland-Battelle)

MIREX INCORPORATION IN THE ENVIRONMENT: TOXICITY IN SELECTED FRESHWATER ORGANISMS,
Mississippi State Univ., State College. Dept. of Zoology.
S. M. Naqvi, and A. A. de la Cruz.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 5, p 305-308, November 1973. 3 tab, 9 ref.

Descriptors: *Pesticides, *Toxicity, Amphipoda, Dragonflies, Shrimp, *Bioassay, Ponds, Lakes, *Mississippi, Lethal limit, Computer programs, Water beetles, Chlorinated hydrocarbon, Pesticides, Insecticides.
Identifiers: *Mirex, Gyrinid beetles, Water striders, Hyallela azteca, Dineutes americanus, Gerris remigis, Palaemonetes kadiakensis, Beetles, Macroinvertebrates, Median tolerance limit.

A study was conducted to determine the toxicity of Mirex to the following pond invertebrates: amphipods (Hyallela azteca), dragonfly nymph (Macromia sp.), a gyrinid beetle (Dineutes americanus), a water strider (Gerris remigis), and a shrimp (Palaemonetes kadiakensis). The specimens were taken with nets from a garden pond and a managed lake in Mississippi. Bioassay solutions were prepared by serial dilution with tap water from a 1 percent stock solution of technical grade Mirex in acetone. LD sub 30, LD sub 50, LD sub 99 and upper and lower limits of lethal concentrations in parts per million for Gerris, Dineutes, and Palaemonetes were determined by probit analysis on an IBM 360-40 digital computer. Percent mortalities but not LD values were considered for Hyallela and Macromia nymph at 1 ppb and 1 ppm Mirex concentrations. Representative TL sub 50 values were: Gerris, 0.13 ppm at 24 hr; Dineutes, 0.04 at 72 hr; and Palaemonetes, 0.19 at 120 hr. Palaemonetes was most resistant, Dineutes next, and Gerris least resistant to Mirex. The results also show a delayed mortality effect of Mirex. (Mortland-Battelle)
W74-06032

EFFECT OF WATER HARDNESS ON THE TOLERANCE OF THE GUPPY TO BERYLLIUM SULFATE,
Johns Hopkins Univ., Baltimore, Md.
C. B. Slonim, and A. R. Slonim.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 5, p 295-301, November 1973. 4 fig, 2 tab, 9 ref.

Descriptors: *Hardness(Water), *Bioassay, Beryllium, Equations, Estimating, *Toxicity, Resistance, Hydrogen ion concentration, Water quality, Alkalinity, Dissolved oxygen, Conductivity, *Sulfates, Lethal limit, Water pollution effects.
Identifiers: *Guppy, *Beryllium sulfate.

Bioassays were conducted to investigate the effect of water hardness on the toxicity of BeSO4 to guppies. Four static tests were conducted simultaneously with four levels of hardness (22,150, 275, 400 mg/l) and Be concentrations ranging from 0.1 to 60 mg/l. In addition, two subsequent bioassays were conducted to assess the hypothetical relationship between the TL sub 50 and water hardness. Median tolerance limits for 96 hour tests were 20.0 mg Be/l at 400 mg/l hardness, 13.7 mg Be/l at 275 mg/l hardness, 6.1 mg Be/l at 150 mg/l hardness, and 0.16 mg Be/l at 22 mg/l hardness. Curves resulting from plots of percent survivors vs. Be concentrations show downturns as water hardness is lowered. In hard water, TL sub 50 values did not change significantly after 24-hr exposures, but in soft water they were significantly lower from 24-to 96-hr exposures. Equations are included which can be used to estimate the toxicity of BeSO4 to guppies at any given water hardness. (Mortland-Battelle)

THE ACUTE TOXICITY OF SOME HEAVY METAL IONS TOWARD BENTHIC ORGANISMS,
Marist Coll., Poughkeepsie, N.Y. Environmental Science Program.
R. Rehwoldt, L. Lasko, C. Shaw, and E. Wirhowski.
Bulletin of Environmental Contamination and Toxicology, Vol 50, No 5, p 291-294, November 1973. 2 tab, 10 ref.

Descriptors: *Toxicity, *New York, Copper, Zinc, Nickel, Cadmium, Mercury, Chromium, *Bioassay, *Benthic fauna, Oligochaetes, Amphipoda, Caddisflies, Diptera, Gastropods, Ions, Water quality, Water temperature, Hardness(Water), Hydrogen ion concentration, Dissolved oxygen, Mud bottom, Sampling, Dredging,

*Hudson River, *Heavy metals, Water pollution effects.
Identifiers: *Metal ions.

A study was conducted to determine the toxicity of some heavy metal ions toward benthic fauna in a freshwater region of the Hudson River. Metal ions evaluated were copper, zinc, nickel, cadmium, mercury, and chromium. Water quality during the experiment was maintained at 17C, 50 mg/l hardness, 7.6 pH, and 6.2 mg/l dissolved oxygen. Mercury was the most toxic ion toward the test organisms (bristle worms, scud, caddisflies, damselflies, midges, and snails) and was more toxic toward these organisms than toward fish studied earlier in the same area. However, with the exception of the scud and midge, benthic organisms tend to be more able to withstand heavy metal inputs than fish. (Mortland-Battelle)

PREDICTION OF INCIPIENT LETHAL LEVELS OF COPPER TO JUVENILE ATLANTIC SALMON IN THE PRESENCE OF HUMIC ACID BY CUPRIC ELECTRODE,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
P. Zitko, W. V. Carson, and W. G. Carson.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 6, p 265-271, November 1973. 2 fig, 1 tab, 13 ref.

Descriptors: *Copper, *Lethal limit, *Atlantic salmon, *Zinc, Humic acids, *Toxicity, *Electrodes, Bioassay, Hardness(Water), Calcium sulfate, Fulvic acids, Spectrophotometry, Heavy metals, Methodology, Chelation.
Identifiers: Ion selective electrodes, Incipient lethal levels.

This paper deals with the toxicity of copper and zinc to juvenile Atlantic salmon in the presence of humic acid, and with predictions of incipient lethal levels (ILL) of copper from the potential of a cupric ion selective electrode. The ILL of copper increases with increasing concentration of humic acid. The potential of the cupric ion selective electrode is a linear function of the total copper concentration in semilogarithmic coordinates. The ratio of predicted to calculated ILL's decreases with increasing hardness due to decreased binding of copper by humic acid at higher hardness. Humic acid at concentrations of 5 and 10 mg/l has no effect on the ILL of zinc to juvenile Atlantic salmon, possibly due to lower stability of humic acid - zinc complexes. The zinc - fulvic acid complex is approximately 10 times less stable than the corresponding copper - fulvic acid complex. The presented data indicate that the cupric ion selective electrode is a useful tool for predicting ILL of copper to juvenile Atlantic salmon in the presence of humic acid. The technique may very likely be extended to other copper-complexing substances such as lignosulfonates, pulp mill effluents in general, and various organic compounds. (Mortland-Battelle)

NOTES ON THE UPPER LETHAL TEMPERATURE OF THE DUSKYSTRIPE SHINER, NOTROPIS PILSBRYI, AND THE BLUEGILL, LEPOMIS MACROCHIRUS,
Arkansas Univ., Fayetteville. Dept. of Zoology.
G. D. Hickman, and M. R. Dewey.
Transactions of the American Fisheries Society, Vol 102, No 4, p 838-840, October 1973. 2 fig, 1 tab, 10 ref.

Descriptors: *Water temperature, *Lethal limit, *Shiners, *Sunfishes, *Thermal pollution, Resistance, Bioassay.
Identifiers: Survival, *Lethal temperature, Notropis pilsbryi, Lepomis macrochirus.

Sublethal, incipient upper lethal, and total lethal temperatures were obtained for the duskystripe shiner, Notropis pilsbryi, and the bluegill, Lepomis macrochirus. Both species were exposed to a gradual temperature increase of 2C per day and to sudden temperature increases after being acclimated to a temperature of 21.5C. Results indicate that the incipient upper lethal temperature of the bluegill, with a 2C rise in temperature per day, is 35.5C and that of the duskystripe shiner is approximately 32.0C. Resistance times of both species to a sudden temperature increase were also determined. (Mortland-Battelle)

THE INFLUENCE OF DISSOLVED OXYGEN ON THE GROWTH OF CHANNEL CATFISH,
Skidaway Inst. of Oceanography, Savannah, Ga.
J. W. Andrews, T. Murai, and G. Gibbons.
Transactions of the American Fisheries Society, Vol 102, No 4, p 835-838, October 1973. 1 fig, 2 tab, 15 ref.

Descriptors: *Dissolved oxygen, *Channel catfish, *Growth rates, Biomass, *Feeding rates, Water quality, Carbon dioxide, Ammonia, Resistance, Bioassay, Water pollution effects.
Identifiers: Blood samples, Hemoglobin, Hematocrit, Survival.

The long-term effects of three levels of dissolved oxygen (100,60 and 36 percent of air saturation) on channel catfish, Ictalurus punctatus, were evaluated under two feeding regimes - a constant rate of 3 percent of biomass daily and ad libitum. At ad libitum rates (6-week duration) average gains of 159, 124, and 65 g per fish were obtained in tanks containing oxygen at 100, 60, and 36 percent of saturation, respectively. In both experiments food consumption and efficiency were drastically reduced at 36 percent oxygen saturation. Survival rates were 100 percent in all groups, thus suggesting that disease and parasite problems were not enhanced by a hypoxic environment. In these studies catfish did not demonstrate a polycythemic response to hypoxic conditions. (Mortland-Battelle)

ACUTE TOXICITIES OF ANTIMYCIN A, BAYER 73, AND TFM TO THE OSTRACOD CYPRETTA KAWATAI,
Viterbo Coll., La Crosse, Wis. Dept. of Biology.
J. A. Kawatski.
Transactions of the American Fisheries Society, Vol 102, No 4, p 829-831, October 1973. 2 tab, 12 ref.

Descriptors: *Invertebrates, *Pesticide toxicity, Bioassay, Lethal limit, Piscicides, Molluscicides, Water pollution effects.
Identifiers: *Ostracods, *Antimycin A, *Bayer 73, *TFM, Synergistic effects, Median tolerance limit.

Static bioassays were conducted at 24C with the ostracod Cypretta kawatai in 1500-ml glass beakers to investigate the toxicity of antimycin A, TFM (95.7 percent 3-trifluoromethyl-4-nitrophenol), Bayer 73 (70 percent 2-aminoethanol salt of 2',5-dichloro-4'-nitrosalicylanilide), and mixtures of TFM and Bayer 73. Mortality observations were made at 24-hr intervals up to 96 hr. The 96-hr LC50 values were: antimycin A, 7.40 micrograms/l; TFM 7.10 mg/l; Bayer 73, 1.16 mg/l. The toxicity of a 50:50 mixture of TFM and Bayer 73 was simply additive (96-hr LC50, 3.03 mg/l), whereas a 98:2 combination of TFM and Bayer 73 was slightly synergistic (96-hr LC50, 5.00 mg/l). The three toxicants tested would have no significant immediate effect on C. kawatai when employed at normal field concentrations for short periods of time, however, if the toxicants were to persist in the ostracod's environment at application concentrations for more than 48 hours, material loss of ostracods could occur. (Mortland-Battelle)

THE EFFECTS OF DIBROM ON RESPIRATORY ACTIVITY OF THE STONEFLY, HYDROPERLA CROSBYI, HELLGRAMMITE, CORYDALUS CORNUTUS AND THE GOLDEN SHINER, NOTEMIGONUS CRYSOLEUCAS,
North Texas State Univ., Denton. Dept. of Biology.
A. W. Maki, K. W. Stewart, and J. K. G. Silvey.
Transactions of the American Fisheries Society, Vol 102, No 4, p 806-815, October 1973. 6 fig, 3 tab, 34 ref.

Descriptors: *Stoneflies, *Shiners, *Respiration, *Insecticides, Oxygen, Water pollution effects, Bioassay, Pesticide toxicity, Resistance, Laboratory equipment, Larvae, Design criteria, Statistical methods, Lethal limit.
Identifiers: *Hellgrammites, *Dibrom, Macroinvertebrates, Continuous flow technique, Oxygen consumption, Respirometers, Hydroperla crosbyi, Corydalus cornutus, Notemigonus crysoleucas.

The respiratory activity of three aquatic animals, selected from different pollution index classifications, was examined in the presence of sublethal concentrations of Dibrom, a commonly used, broad spectrum, organophosphate insecticide. The oxygen consumption of Hydroperla crosbyi (Needham and Classen), Corydalus cornutus L. and Notemigonus crysoleucas was measured in a specially designed flowing-water respirometer, housed in an environmental chamber. The acute toxicity of Dibrom, measured as 24-hr LC50's for these animals, was compared in both static and flowing-water bioassays and found to be significantly more toxic to both the hellgrammites and stoneflies in the flowing system (LC50: 6.8 ppm and 11.4 ppb, respectively) than in the static bioassay (LC50: 9.5 ppm and 16.0 ppb, respectively). There was a marked difference in the toxicity of Dibrom to golden shiners between flowing and static systems but this was not statistically significant at the 95 percent confidence level. Sublethal Dibrom concentrations significantly affected oxygen consumption (QO2) in all test animals, and reduced their tolerance to low oxygen tensions. The ability of the golden shiner to tolerate low oxygen tensions was reduced by 50 percent by exposure to 5 ppm Dibrom concentrations. Stonefly body undulations and hellgrammite gill beats were increased by exposure to sublethal toxicant levels in the flowing system. The flowing-water respirometer offers an approach to simulate the lotic environment in bioassays and laboratory assessments of the effects of pollutants on respiration and other organism responses. (Mortland-Battelle)

EFFECTS OF ARTIFICIAL HYPOLIMNION AERATION AND RAINBOW TROUT (SALMO GAIRDNERI RICHARDSON) DEPTH DISTRIBUTION,
Michigan State Univ., East Lansing.
A. W. Fast.
Transactions of the American Fisheries Society, Vol 102, No 4, p 715-722, October 1973. 7 fig, 21 ref.

Descriptors: *Rainbow trout, *Distribution patterns, *Aeration, Depth, *Hypolimnion, Oxygen, Thermal stratification, Water temperature, *Michigan, *Eutrophication.
Identifiers: *Hemlock Lake(Mich).

Hemlock Lake, an eutrophic and meromictic Michigan lake, was artificially aerated by hypolimnetic aeration. This aeration system involved a special aeration tower and compressed air injection. Hypolimnetic oxygen concentrations increased from zero to saturation during aeration. Thermal stratification was gradually reduced by the aeration, but the lake remained thermally stratified for 10 weeks during aeration. Before aeration, rainbow trout (Salmo gairdneri Richardson) were limited to shallow depths by the anaerobic hypolimnion. They distributed to the deepest

depths soon after aeration began and occupied the entire lake during artificial aeration. (Mortland-Battelle)

BENTHIC FAUNA AND ZOOPLANKTON IN SOME POLLUTED SWEDISH ESTUARIES,
Uppsala Univ. (Sweden). Inst. of Zoology.
I. Olsson, R. Rosenberg, and E. Olundh.
AMBIO, Vol 2, No 5, p 158-163, 1973. 9 fig, 16 ref.

Descriptors: *Benthic fauna, *Zooplankton, *Estuaries, Salinity, Water pollution effects, Annelids, Crustaceans, Oxygen, Worms, Copepods, Bioindicators, Dominant organisms, Clams, Aquatic populations.
Identifiers: Ostracods, Foraminifera, Species diversity, Macroinvertebrates, *Sweden, Saltkallefjord, Byfjorden, Gothenburg estuary, Kungsbackafjorden.

Four more-or-less polluted estuaries on the Swedish west coast are compared regarding bottom fauna of different sizes, and zooplankton. The salinity in these almost non-tidal waters varies from estuary to estuary and decreases from north to south. As it was expected that the physical and chemical environment in the estuarine systems might be reflected in the faunal communities, the purpose was to classify the systems in respect to each other on a faunal basis, especially with regard to the pollution aspects. The meiofauna of the bottom (size 0.1-1 mm), represented by foraminifers (one-celled animals) and annelids (segmented worms), seemed more to reflect differences in pollution than differences in salinity. A reduced ostracod fauna (crustaceans) was an outstanding feature. Few species appeared in all estuaries. Even the macrofauna of the bottom (size greater than or equal to 1 mm) showed that the effects of pollution in Byfjorden were restricted to the inner areas. In a comparison with another estuary, Saltkallefjorden, nowadays almost non-polluted and recovered, there was a remarkably uniform fauna at certain localities in the two estuaries. If distance to river-mouth is taken into consideration, both meio- and macrofaunal composition seemed to be more similar between the various estuaries than within individual estuaries, reflecting the short-distance changes of the environment. Compared to the bottom fauna, the zooplankton (greater than or equal to 0.16 mm) showed the least differences between the various estuaries. The composition seemed to be much the same, with copepods (crustaceans) as the dominating group. (Mortland-Battelle)

INDICATIONS OF DISTURBANCES IN THE NITRIFICATION PROCESS IN A HEAVILY NITROGEN-POLLUTED WATER BODY,
Swedish Water and Air Pollution Research Lab., Stockholm.
L. Landner, and T. Larsson.
AMBIO, Vol 2, No 5, p 154-157, 1973. 6 fig, 17 ref.

Descriptors: *Nitrification, *Water pollution effects, *Nitrogen fixing bacteria, Nitrogen, Nitrites, Oxygen, Ammonium compounds, Nitrates, Benthos, Metabolism, Respiration, Sampling, Oxidation, *Bioindicators, Ecosystems, Lakes, Nitrogen compounds, Industrial water, Sediments, Cycling nutrients, Aquatic populations, Biological communities.
Identifiers: Nitrobacter, Nitrosomonas, Biotransformation, *Sweden(Lake Malaren).

When high concentrations of nitrite were repeatedly detected in the Bay of Koping, Lake Malaren (Sweden), a study was initiated to analyze the autotrophic oxidation of ammonium to nitrate. The number of denitrifiers and of heterotrophs was also determined. Water and sediment samples were taken with sterilized NIVA and Jenkins samplers on four occasions, and the numbers of autotrophically nitrifying bacteria were determined by indirect most probable number procedures. It was found that Nitrosomonas were 100 to 10,000 times more abundant than Nitrobacter in the bottom water as well as in the sediment surface of the bay. The activity of Nitrobacter in the bay was also reduced, clearly indicating a disturbance of the oxidation of nitrite to nitrate. (Mortland-Battelle)

EFFECTS OF THERMAL ADDITIONS FROM THE YELLOWSTONE GEYSER BASINS ON THE BENTHIC ALGAE OF THE FIREHOLE RIVER,
Wisconsin Univ., Madison. Dept. of Bacteriology.
C. W. Boylen, and T. D. Brock.
Ecology, Vol 54, No 6, p 1282-1291, Autumn 1973. 8 fig, 2 tab, 27 ref.

Descriptors: *Thermal pollution, *Benthic flora, *Geysers, *Water temperature, Alkalinity, Hydrogen ion concentration, Conductivity, Phosphates, Chlorides, Nitrates, Ammonia, Chlorophyll, Growth rates, Photosynthesis, Radioactivity techniques, *Aquatic algae, Standing crops, Hot springs, Carbon dioxide, Nutrients, Water quality, Analytical techniques, Biomass, Systematics, Sampling, Adaptation, Water analysis, On-site tests, *Wyoming.
Identifiers: *Firehole River(Wyo).

During the spring and summer of 1971 and 1972 quantitative measurements of temperature, water chemistry, and standing crop of benthic algal mats were made at a series of stations along the Firehole River as it flows through the main geyser basins of Yellowstone National Park. As the river flowed through the thermal areas, the temperature gradually increased to a maximum daily midsummer temperature 12 degrees higher than the unheated upper portion of the river (15 to 27C), and the river began cooling when the thermal additions to the river ceased. The river was coldest in early June, when maximum input from melting snow occurred, and remained relatively warm in the heated areas throughout the winter. Alkalinity pH, conductivity, phosphate, and chloride also increased markedly; nitrate and ammonium concentrations appeared not to be influenced by the additions of hot spring water. The quantity of chlorophyll per unit area extracted from epilithic algal mats also increased with the amount of thermal water input to 20 times that in the unheated control areas. The apparent growth rates of benthic algae calculated from periodic quantitative sampling of cleaned rocks were over fivefold greater in the warmer than in the cooler portion of the river. The temperature optimum for CO2 fixation paralleled the midsummer temperature of the habitat although it averaged about 3 degrees higher at each station. The results suggest that higher temperatures from the additions of thermal water increase the algal standing crop through increase in growth rate of the algae, and that the algae in the heated portion of the river are optimally adapted to the temperatures of their habitats. MULTIVARIATE APPROACHES TO ALGAL STRATAGEMS AND TACTICS IN SYSTEMS ANALYSIS OF PHYTOPLANKTON,
Wisconsin Univ., Madison. Dept. of Botany.
T. F. H. Allen, and J. F. Koonce.
Ecology, Vol 54, No 6, p 1234-1246, Autumn 1973. 12 fig, 3 tab, 37 ref.

Descriptors: *Phytoplankton, *Statistical methods, *Productivity, Growth rates, Absorption, Biomass, Biological communities, Ecosystems, Model studies, Grazing, Seasonal, Standing crops, Algae, Niches, Competition, Distribution patterns, Dominant organisms, *Wisconsin.
Identifiers: Data interpretation, *Multivariate analysis, *Lake Wingra(Wis).

Numerical classifications and principal components ordinations were performed on species from 57 weekly samples of phytoplankton from Lake Wingra. The data were considered in absolute and relative terms before and after transformation to presence/absence and logarithmic quantities. The data were also analyzed, taking into account growth rates in the samples, by means of a transformation that replaced the scores of species present by the productivity of the sample as determined by C-14 uptake/biomass. It is shown that different transformations can reveal different but biologically meaningful aspects of the data. These different biological aspects are species similarities based on either short-term survival expedients in particular environmental circumstances, species tactics, or long-range growth patterns, involving breadth of tolerance and place in the community, that is, species stratagems. Most phytoplankton species in Lake Wingra adopt one of three stratagems: either ungrazed, slow-growing and very persistent, or ungrazed, fast-growing and of intermediate duration, or grazed fast-growing and ephemeral. Tactical information is relevant to particular systems, while strategic information is needed in ecosystem comparison and for models applicable to several systems. (Mortland-Battelle)

EFFECT OF CHELATION ON TOXICITY OF COPPER,
Leigh (W. and J.) and Co., Bolton (England).
O. P. Morris, and G. Russell.
Marine Pollution Bulletin, Vol 4, No 10, p 159-160, October 1973. 1 fig, 9 ref.

Descriptors: *Chelation, *Toxicity, *Copper, *Marine algae, Organic compounds, Cultures, Aqueous solutions, Chlorides, Growth rates, Volumetric analysis, Bioassay, Heavy metals, Water pollution effects, Sea water, Phaeophyta, Kelps.
Identifiers: *EDTA, Erd Schreiber medium, Culture media, *Ectocarpus siliculosus.

The effect of chelation on copper toxicity to algae was studied in the laboratory using EDTA as a chelating agent and Ectocarpus siliculosus as the algae. Three growth media were used. The basic medium was a formulation with Na2 EDTA excluded to make the medium as inorganic as possible. The second consisted of the basic formulation plus 3.7 mg EDTA per liter. The third was 'Erd Schreiber' medium, which contains soil extract. A series of copper concentrations was prepared in each medium giving from 0.00 to 1.00 mg Cu (2 plus)/liter. The plant material was inoculated into the media and cultures were grown at 11C and a continuous light intensity of 2,700 lux. Volumetric analysis of growth was made after 35 days. The growth rate of Ectocarpus in the basic medium dropped very rapidly with increasing copper, and there was no increase in plant volume over 35 days, at a concentration of 0.45 mg Cu (2 plus)/l. The presence of EDTA increased this critical concentration, the Ectocarpus continuing to show some growth up to a level of over 0.85 mg Cu (2 plus)/l. It was concluded that the effect of chelation on the toxicity of copper to Ectocarpus siliculosus in culture is very marked. (Mortland-Battelle)

Identifiers: Lubricating oil, Fuel oil, Flatfish, *Scotland(Firth of Clyde), Plaice, Tellina tenuis, Scallops, Cod(Fish), Haddock, Mackerel, Saithe, Whiting.

The water quality and the effects of pollution on the Firth of Clyde are being monitored; surveys were made of the plankton, benthic and fish populations of the area. Pollutants identified were sewage sludge; heavy metals such as Cu, Pb, Zn, Cd, and Hg; trace organics; PCB's; pesticides such as dieldrin and DDT; crude fuel and lubricating oils; and heated water. Levels of metals in fish, shellfish, sediments, zooplankton, and water and the levels of dieldrin, DDE, TDE, DDT, and PCB in fish are listed. Bioassays with flatfish, plaice, the bivalve Tellina tenuis, and herring eggs and larvae show that copper concentrations of 10 micrograms/l have adverse effects on the food chain leading to young flatfish and at levels above this, herring eggs are affected. Excess nutrients apparently lower grazing rates which may be the reason for the occurrence of higher chlorophyll concentrations in the Firth. There are three main conclusions from this study. (1) There is evidence of enhanced levels of contaminants in the Clyde. (2) This evidence is found most obviously at intermediate trophic levels (Tellina and zooplankton), rather than in the water or the fish. (3) Experiments show direct effects on organisms from this area which are comparable to effects found by contaminated additions to unpolluted waters, but the exact cause or causes remain to be determined. THE DISTRIBUTION OF ASELLUS AQUATICUS (L.) AND PROASELLUS MERIDIANUS (RAC.) IN THE SOUTHWESTERN PART OF THE NETHERLANDS,
Delta Inst. for Hydrobiologycal Studies, Yerseke (Netherlands).
W. J. Wolff.
Hydrobiologia, Vol 42, No 4, p 381-392, September 28, 1973. 7 fig, 2 tab, 22 ref.

Descriptors: *Distribution patterns, *Salinity, Systematics, Water pollution effects, Habitats, Water quality, Brackish water, *Isopods, Sampling, Salts, Phenols, Resistance, Water quality. 25*Asellus aquaticus, *Proasellus meridianus, *Netherlands, Macroinvertebrates.

The freshwater isopods Asellus aquaticus and Proasellus meridianus are common in the Netherlands. The distribution of both species in the southwestern part of the Netherlands seems to indicate that small ecological differences between both species exist. These differences are discussed in relation to the results of previous authors. The ecological similarity of the two species apparently may be extended to their tolerance to raised salinities. On the other hand it was possible to confirm that these species react differently to water pollution. The main conclusion of this study is, however, that A. aquaticus and P. meridianus form an extremely interesting couple of species. A study of the way they colonize the future fresh Delta lakes therefore may result in valuable data on interaction of closely related species, and also has considerable theoretical interest. Such a study is planned. (Mortland-Battelle)

DIVERSITY IN FRESH-WATER PHYTOPLANKTON,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
B. Moss.
The American Midland Naturalist, Vol 90, No 2, p 341-355, October 1973. 4 fig, 1 tab, 46 ref.

Descriptors: *Phytoplankton, *Seasonal, *Nutrients, *Mathematical models, Water quality, Eutrophication, Succession, Dominant organisms, Equations, Pigments, Biomass, *Michigan, Lakes.
Identifiers: *Species diversity, Data interpretation, Priddly Pool(U. K.), Abbot's Pond(U. K.), Gull Lake(Mich.), United Kingdom.

Phytoplankton samples were collected from three water bodies, Gull Lake (Kalamazoo, Mich.), Priddy Pool, and Abbot's Pond (Somerset, U. K.), for as long as 2 years, the species counted, and diversity calculated using a derivative of the Shannon formula. In the more eutrophic bodies, diversity increased in summer but was low in winter. Diversity decreased with increased fertility of the water. The data confirm predictions made in the literature, but existing explanations of the phenomena are considered unnecessarily complex. An explanation based on the balance of cell numbers between overlapping populations of several species is given, supported by a simple mathematical model. The pigment diversity index and the nature of succession (periodicity) in freshwater phytoplankton are discussed. (Little-Battelle)

ENDRIN UPTAKE AND RELEASE BY FINGERLING CHANNEL CATFISH (ICTALURUS PUNCTATUS),
Bureau of Sport Fisheries and Wildlife, Marion, Ala. Southeastern Fish Cultural Lab.
R. L. Argyle, G. C. Williams, and H. K. Dupree.
Journal of the Fisheries Research Board of Canada, Vol 30, No 11, p 1743-1744, November 1973. 3 ref.

Descriptors: *Bioassay, *Channel catfish, *Mortality, *Growth rates, *Endrin, Absorption, Fishkill, Gas chromatography, Resistance, Foods, Juvenile fish, Fry.
Identifiers: Elimination, *Bioaccumulation, Biological samples, Tissue, Sample preparation.

Fingerling channel catfish (Ictalurus punctatus) offered diets containing 0.04-4.0 micrograms endrin/g food (dry weight) rapidly accumulated the pesticide. Amounts in the tissues as determined by gas chromatography were directly proportional to amounts in the food. Dietary endrin had no measurable effect on growth or mortality. After endrin was withdrawn from the diet, it rapidly disappeared and could not be detected after 41 days. In fish exposed to 0.5 microgram endrin/liter of water, mortalities began at tissue levels of 0.7 microgram endrin/g of wet whole fish and total mortality occurred at levels near 1.0 microgram/g. INFLUENCE OF ENVIRONMENTAL EXPERIENCE ON RESPONSE OF YEARLING RAINBOW TROUT (SALMO GARIDNERI) TO A BLACK AND WHITE SUBSTRATE,
Guelph Univ. (Ontario). Coll. of Biological Science.
J. A. Ritter, and H. R. MacCrimmon.
Journal of the Fisheries Research Board of Canada, Vol 30, No 11, p 1740-1742, November 1973. 1 tab, 6 ref.

Descriptors: *Rainbow trout, *Color, *Distribution patterns, Sediments, Bioassay, Environmental effects, *Fish behavior, Juvenile fish.
Identifiers: *Substrates.

Yearling rainbow trout (Salmo gairdneri) selected black substrate regardless of size or rearing experience when first introduced into an experimental tank offering a choice of black or white. Differences in the degree of black selection among the various lots of the same strain during the initial 120 min of exposure, under an illumination of .01 lx, were correlated only with the level of swimming activity. By 24 hr, only pond-reared fish continued to select black while laboratory-reared fish were randomly distributed over black and white. The continuing wariness of only the pond-reared fish reveals the long-term effect of prior experience of juvenile trout behavior. This finding indicates the possible feasibility of environmental conditioning for wariness in the artificial propagation of hatchery-reared fish for the live release. (Little-Battelle)

METABOLISM OF SELECTED PESTICIDES BY MARINE MICROORGANISMS,
Syracuse Univ. Research Corp., N.Y. Life Sciences Div.
H. C. Sikka, S. Miyazaki, and C. P. Rice.
Available from the National Technical Information Service as AD-763 410, $3.00 in paper copy, $1.45 in microfiche. Report No. SURC-TR 73 520, Annual Report No. 2, June 1973. 16 p, 4 tab, 7 ref. Project No. NR-306 050. Contract No. N00014-72 C 0010.

Descriptors: *Metabolism, *Microbial degradation, *Marine microorganisms, Absorption, Radioactivity techniques, Biodegradation, Photosynthesis, Growth rates, Marine bacteria, Marine algae, Marine fungi, Pesticide toxicity, Plant physiology, Water pollution effects, Phenolic pesticides, Yeasts, Plant growth, Cultures, Incubation, Analytical techniques, Carbamate pesticides, Pollutant identification.
Identifiers: *Carbaryl, *Naphthols, *Fate of pollutants, Bacterial physiology, Metabolites, Cyclotella, Dunaliella, Flavobacterium, Rhodotorula, Spirillum, Liquid scintillation, Brevibacterium, Candida, Trichosporon, Culture media, Humicola, Serratia, Algal physiology, Degradation products, Aspergillus, Halosphenica, Culcitaena.

A number of marine microorganisms including algae, bacteria, fungi and yeasts were tested for their ability to metabolize carbaryl (1-naphthyl-N-methyl-carbamate) and 1-naphthol. None of the

species included in the study were able to degrade carbaryl to a significant extent. Conversion of 1-naphthol to ether-soluble and water-soluble metabolites was observed in cultures of Culcitalna achraspora, Halosphaeria mediosetigera, Humicola alopallonella, Aspergillus fumigatus, Serratia marina, Spirillum sp. and Flavobacterium sp. The first three organisms were more effective in degrading 1-naphthol to water-soluble metabolites than the remaining species. A very small amount of carbaryl was metabolized to water-soluble metabolites by the algae Cyclotella nana and Dunaliella tertiolecta. 1-naphthol was more toxic to the algae Cyclotella and Dunaliella than the parent compound, carbaryl. Cyclotella was more sensitive to both carbaryl and 1-naphtol than Dunaliella. Treatment with 0.00002 M carbaryl or 1-naphthol reduced photosynthetic CO2 fixation in Cyclotella. (Mortland-Battelle)

BENTHIC OXYGEN DEMANDS OF HOUSTON SHIP CHANNEL SEDIMENTS,
Texas A and M Univ., College Station. Dept. of Civil Engineering.
T. D. Reynolds, R. W. Hann, Jr., and W. F. Priebe.
Available from the National Technical Information Service as COM73-11329 $3.50 in paper copy, $1.45 in microfiche. Report No. TAMU-SG-73-204, June 1973. 58 p, 17 fig, 4 tab, 47 ref, append. Grant Nos. NOAA-04-3-158-18, EPA-WP-24001, and EPA R and D 16090 DQW.

Descriptors: *Dissolved oxygen, *Oxygen demand, *Bottom sediments, Sea water, *Biochemical oxygen demand, Water quality, Water temperature, Mixing, Sludge, Mud, Suspended solids, Absorption, Mercury, Lead, Zinc, Copper, Chromium, Nickel, Iron, Manganese, *Texas.
Identifiers: *Houston Ship Channel(Tex), Marine environment, Electrolytic oxygen cells, Arsenic, Silver.

The purpose of this research was to determine the benthic demand of the deposits in the Houston Ship Channel for use in modeling the channel for dissolved oxygen. The scope of the study included: (1) collection of bottom samples; (2) determining characteristics of the sludge such as biochemical oxygen demand (BOD), heavy metals, etc.; (3) use of galvanic oxygen cells in determining oxygen uptake rates in grams of oxygen per hour per square meter, or other units; (4) determination of benthic demands at different temperatures to obtain a demand versus temperature correlation; and (5) the determination of mixing effects. The benthic demands were determined using electrolytic biochemical oxygen demand cells and the sludges were placed in the cells within 24 hours after collection. Nine sludge samples were taken from the entire 24-mile reach of the channel and benthic demands were determined at 32C. Correlations were made relating benthic demand to the five-day biochemical oxygen demand of the sludges. The water in the cells was recirculated to the extent that the sludge surface was scoured to determine if a scoured condition increased the benthic demand over that of a quiescent condition. Mass transfer fundamentals were used to determine the benthic demand as a function of ultimate benthic demand, time, and molecular diffusivity. (Mortland-Battelle)

ECOLOGY OF SMALL BOAT MARINAS,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
S. W. Nixon, C. A. Oviatt, and S. L. Northby.
Available from the National Technical Information Service as COM73-11303 $1.00 in paper copy, $1.45 in microfiche. Marine Technical Report Series No. 5, 1973. 20 p, 15 fig, 13 tab, 38 ref.

Descriptors: *Marinas, *Salt marshes, *Productivity, *Respiration, *Ecology, *Rhode Island, Marsh plants, Nutrients, Suspended solids, Phytoplankton, Organic matter, Copper, Sediments, Biomass, Water quality, Metabolism, Estuaries, Dissolved oxygen, Water analysis, Fouling, Marine algae, Standing crops, Chemical analysis, Plant tissues, Biological communities, Dissolved solids, Water sampling, Duirnal, Toxicity, Distribution patterns, Detritus.
Identifiers: Species diversity, Species abundance, Animal tissues, Wickford Harbor(R.I), Coves, *Narragansett Bay(R.I), Mummichogs, Menhaden, Chlorophyll a, Particulate matter, Marsh grass, Mill Creek, Fecal coliforms, Dissolved organic matter, Atlantic silverside, Grass shrimp, Barnacles, Tunicates, Sponges, Coelenterates, Polychaetes, Ectoprocts.

In Wickford Harbor, Rhode Island, a yacht marina area and a salt marsh cove were considered as ecological systems and compared to evaluate biological populations and magnitudes of production and respiration. Volume and flushing characteristics of both areas were similar. Analyses were made in each cove on marsh grass production, suspended particulate matter, phytoplankton, nutrients, bacteria, dissolved organics, copper levels, fish and sediments. Biomass and metabolim measurements were made on the fouling communities present on floats and pilings in the marinas. Preliminary bioassays were performed with concentrations of outboard motor exhaust water on several species of estuarine organisms. Some additional comparative measurements were taken inside and outside other marinas located in Narragansett Bay. No major differences were found in marsh grass production, concentrations of suspended particulate matter, nutrients, bacteria, dissolved organics, infauna, or sediment metabolism. Copper levels, while lower than toxic concentrations reported in the literature, were higher in the marina cove, ranging from 0.009 microgram in the water to 160 micrograms in the fouling community. Fish species reached the same levels of diversity in both the marina and the marsh cove, but abundance was greater in the marsh cove due to the presence of dense juvenile menhaden schools. The fouling communities of the marinas, which appear to be a food source for juvenile mummichogs (Fundulus heteroclitus), exerted a significant oxygen demand on the marina cove. Diurnal curves of dissolved oxygen showed lower concentrations at the end of the night in marina areas than in adjacent waters. For this reason, and because preliminary bioassays indicated some toxicity due to exhaust waters, it is suggested that marina sites be well flushed with oxygenated tidal waters. The luxurious fouling growths which developed in the marina cove may serve as additional food sources to complement the detritus input from the sal marsh. In most respects the marina cove and th marsh cove appeared to be not only similar, bu also compatible ecological systems. (Mortland Battelle)

PLANKTON PIGMENT HETEROGENEITY I SEVEN RESERVOIRS OF THE LOWE COLORADO BASIN,
Arizona State Univ., Tempe.
D. E. Portz.
Available from the National Technical Informa tion Service as COM-73-11306; for $11.25 in pape copy, $1.45 in microfiche. Report No NOAA 73073008, June 1973. 184 p.

Descriptors: *Plankton, *Pigments, *Reservoirs *Colorado River Basin, Temporal distribution Spatial distribution, Colorado River, Light, Ligh penetration, Turbidity, Environment, Climatolo gy, Water sampling, Stratification, *Southwes U.S., Ecology, Surface waters.
Identifiers: *Salt River.

An examination of spatial and tempor heterogeneities of seven plankton pigments wa made in two reservoir systems of the Salt an Colorado rivers in Southwestern USA. The mai approach developed from a micro- to macro-scal of variation using both profile and surface sam ples. The analysis commenced with inter-sampl differences at differences at fixed locations, fo lowed by intra- and inter-reservoir variation based on constant transect locations. Replicat samples from surface waters exhibited the mo fluctuation in pigment concentration. Profile were most irregular during periods of lake stratif cation. Distance between sampling stations an temporal factors, plus innate characteristics c local water masses contributed to variations withi and among reservoirs. A final comparison c grouped data from the two reservoir systen yielded considerable homogeneity and interrel tionships of pigments were similar for both profi and surface samples in the two systems. Temper ture, percentage light penetration, and turbidi were determined to be most important in influen ing pigment distribution. (Holoman-Battelle)

ENRICHING EFFECTS OF URBAN RUNOF ON THE PRODUCTIVITY OF MESOTROPHIC LAKE,
Washington Univ., Seattle. Dept. of Civil E gineering.
R. M. Emery, C. E. Moon, and E. B. Welch.
Water Research Vol 7, No 10, p 1505-1516, O tober 1973. 4 fig, 4 tab, 15 ref.

Descriptors: *Urban runoff, *Primary productiv ty, *Lakes, *Mesotrophy, *Water pollution e fects, *Eutrophication, Aquatic algae, Nutrient Growth rates, On-site tests, Laboratory test Phytoplankton, Phosphorus, Nitroge Periphyton, Biomass, Radioactivity technique Fluorometry, *Washington, Trophic leve Watersheds(Basins), Streams, Silica, Carbon, A kalinity, Hydrogen ion concentration, Water qual ty, Chlorophyll.
Identifiers: *Lake Sammamsh(Wash), Batch cu tures.

Sewage was diverted from Lake Sammamish September, 1968, and since then there have bee no significant responses by trophic indicato which indicate the lake is beginning to recover. T explain this delay in response, extensive urb development in the lake's watershed was co sidered as a factor which might be acting to inhib the lake's recovery. In vitro uni-algal experimen with water from 13 streams which drain urban ar undeveloped areas showed that about half of t streams stimulated algal growth significantly, b these streams constitute less than 14 percent of t lake's total water income. Of these six strean

nly two drain urban areas and account for less han 2 percent of the water income. In situ experiments showed that no streams were significantly timulatory to natural populations of phytoplankton. Other in situ studies showed that one urban tream and two from undeveloped areas caused ubstantial increases in periphyton growth after a 2-day period, although these increases were not tatistically significant. Additional in situ nutrient imitation experiments in August Of 1970-1971 evealed that P and N were limiting only in combination. Results from these studies do not support he contention that urban runoff is seriously enriching the limnetic region of Lake Sammamish. Mortland-Battelle)

SOME CHARACTERISTICS OF AN OSCILLATORIA-DOMINATED METALIMNETIC PHYTOPLANKTON COMMUNITY,
Allegheny Coll., Meadville, Pa. Dept. of Biology.
. R. Wohler, and R. T. Hartmann.
The Ohio Journal of Science, Vol 73, No 5, p 297-307, September 1973. 4 fig, 4 tab, 27 ref.

Descriptors: *Cyanophyta, *Lakes, *Biological communities, *Dominant organisms, Phytoplankton, Biological properties, Photosynthesis, Light intensity, Water quality, Dissolved oxygen, Carbon dioxide, Phosphates, Chlorophyll, Primary productivity, Radioactivity techniques, Stratification, Distribution patterns, Aquatic productivity, Light, Calcium, Iron, Manganese, Zinc, Seston, *Pennsylvania, Nutrients, Chemical analysis, Alkalinity.
Identifiers: Oscillatoria agardhii, Sample preservation, *Crystal Lake(Penn), Standard Methods.

Crystal Lake, located in Crawford County, Pennsylvania, is a small dimictic lake which during summer stratification contains a large population of Oscillatoria agardhii var. isothrix Skuja in the metalimnetic region. Carbon fixation measurements indicate that this Oscillatoria-dominated community is capable of relatively rapid rates of photosynthesis at low levels of illumination. Analyses of dissolved oxygen, carbon dioxide, phosphate, calcium, iron, manganese, phosphorus, zinc, and chlorophyll a were made on water and seston samples from a vertical water column increased availability of trace nutrients may be involved in the occurrence of the Oscillatoria-dominated community. (Mortland-Battelle)

LIGHT INTENSITY AND PHOTOSYNTHETIC RATES IN PHYTOPLANKTON,
McMaster Univ., Hamilton (Ontario). Dept. of Biology.
. P. Harris, and J. N. A. Lott.
Journal of the Fisheries Research Board of Canada, Vol 30, No 12, Part 1, p 1771-1778, December 1973. 8 fig, 12 ref.

Descriptors: *Light intensity, *Phytoplankton, Physiological ecology, *Environmental effects, Inhibition, Respiration, Photosynthetic oxygen, Diatoms, Plant physiology, Photosynthesis, Chlorophyll, Lake Ontario, Aquatic algae, Chlorella, Sampling.
Identifiers: *Photosynthetic rates, Oxygen evaluation, Desmids, Sample preservation, Cell counts, Scenedesmus quadricauda, Chlorella ellipsoidea, Asterionella, Melosira, Asterionella, Cosmarium botrytis.

The physiological behavior of various phytoplankton species has been examined under increasing and decreasing light regimes. A marked asymmetry has been found, with photosynthesis rates under rising light intensities exceeding those under dimming lights. Photoinhibition has been observed at moderate light intensities (0.4-1.0 ly/min). Variations in the asymmetry and in photoinhibition appear to be correlated with the light regimes experienced by the population. Under constant illumination by full sunlight a steady decrease in the photosynthesis rate was observed. As a result of photosynthesis measurements in fluctuating light regimes there is not evidence for photorespiration as the controlling mechanism. Data are presented which show that prolonged exposure to high light has an adverse effect on photosynthesis and indicate that C-14 moored bottle experiments may show reduced surface rates because of this. (Holoman-Battelle)

DIEL AND ANNUAL CYCLES OF NET PLANKTON PHOTOSYNTHESIS IN LAKE ONTARIO,
McMaster Univ., Hamilton (Ontario). Dept. of Biology.
G. P. Harris.
Journal of the Fisheries Research Board of Canada, Vol 30, No 12, Part 1, p 1779-1787, December 1973. 12 fig, 1 tab, 17 ref.

Descriptors: *Photosynthesis, *Phytoplankton, *Measurement, *Lake Ontario, *Nannoplakton, *Biorythms, Hysteresis, Respiration, Diatoms, Water temperature, Radioactivity techniques, Chlorophyta, Chrysophyta, Light intensity, Cycles, Primary productivity, Aquatic algae.
Identifiers: Photosynthetic rates, Desmids, Diel periodicity, Seasonal variation, Respiration rates, Melosira, Asterionella, Tabellaria, Fragilaria, Photoinhibition, Pediastrum, Ceratium, Staurastrum, Recovery.

Photosynthesis measurements on net plankton have been carried out for the period April, 1972 to January, 1973 in Lake Ontario. The rising and falling light regimes used on the net phytoplankton (greater than 64 microns) give marked photosynthetic hysteresis effects in winter and in spring for diatom-dominated populations. Diel fluctuations in photosynthesis and 'sun' or 'shade' adaptations showed a close interaction between the phytoplankton and the surface light intensity. Systematic seasonal changes have been recorded in the magnitude of the photosynthetic hysteresis effect, saturation light intensities, compensation points, maximum photosynthesis, and respiration rates. An inverse correlation has been found between net plankton mean maximum photosynthesis rates and the rate of change of water temperature. Also phytoplankton respiration rate is largely a function of temperature. The data have been unified to give a picture of daily photosynthesis patterns at different depths in a static water column. The data compare well with C-14 moored bottle experiments. Predictive equations have been calculated for maximum photosynthesis rates at different times of the year. (Holoman-Battelle)

CRAWLING AND RESPIRATION AS INDICES OF SUBLETHAL EFFECTS OF OIL AND A DISPERSANT ON AN INTERTIDAL SNAIL LITTORINA LITTOREA,
Bedford Inst., Dartmouth (Nova Scotia).
B. T. Hargrave, and C. P. Newcombe.
Journal of the Fisheries Research Board of Canada, Vol 30, No 12, Part 1, p 1789-1791, December 1973. 2 fig, 3 tab, 6 ref.

Descriptors: *Animal physiology, Physiological ecology, *Oil wastes, *Toxicity, *Snails, Animal behavior, Respiration, Movement, Intertidal areas, Mollusks, *Water pollution effects, Invertebrates, Absorption, Dissolved oxygen.
Identifiers: *Oil dispersants, Littorina littorea, Bunker C oil, Corexit 8666, Oxygen consumption, Crude oil, Respiration rates, Macroinvertebrates.

The present study indexes sublethal effects of oil and a low toxicity dispersant on an intertidal snail, Littorina littorea, by measurement of changes in crawling and respiration rates. Certain variables which might affect toxicity are considered in an attempt to assess the sensitivity of these measures of sublethal effects. Crawling and respiration rates were increased in the presence of Bunker C oil and decreased with brief exposure to a low toxicity dispersant (Corexit 8666) in seawater at 20 C. The addition of the dispersant to an oil seawater mixture also decreases both crawling and respiration. Behavioral traints, such as crawling, and physiological indices, such as respiration, may be sensitive measures of sublethal effects of pollutants on organisms. (Holoman-Battelle)
W74-06084

CAPTAIN TOXICITY TO FATHEAD MINNOWS (PIMEPHALES PROMELAS), BLUEGILLS (LEPOMIS MACROCHIRUS), AND BROOK TROUT (SALVELINUS FONTINALIS),
National Water Quality Lab., Duluth, Minn.
R. O. Hermanutz, L. H. Mueller, and K. D. Kempfert.
Journal of the Fisheries Research Board of Canada, Vol 30, No 12, Part 1, p 1811-1817, December 1973. 4 tab, 15 ref.

Descriptors: *Pesticide toxicity, *Minnows, *Brook trout, *Sunfishes, Animal growth, Fish reproduction, Water pollution effects, Bioassay, Fungicides, Fish physiology, Testing procedures, Viability, Fecundity, Freshwater fish, Chlorinated hydrocarbon pesticides, Laboratory tests, Embryonic growth stage, Juvenile growth stage, Fry, Fish eggs.
Identifiers: *Fathead minnow, Survival, *Captain, Lepomis macrochirus, Pimephales promelas, Salvelinus fontinalis, Continuous flow system, Hatchability, Median tolerance limit.

The toxic effect of captan on survival, growth, and reproduction of fathead minnows (Pimephales promelas) and on survival of bluegills (Lepomis macrochirus) and brook trout (Salvelinus fontinalis) were determined in a flow-through system. In a 45-week exposure of fathead minnows, survival and growth were adversely affected at 39.5 micrograms/liter. Adverse effects on spawning were suspected but not statistically demonstrated at 39.5 and 16.5 micrograms/liter. The maximum acceptable toxicant concentration (MATC), based on survival and growth, lies between 39.5 and 16.5 micrograms/liter, resulting in an application factor (MATC/LTC) between 0.26 and 0.62. LTC values for the bluegill and brook trout were 72 and 27 micrograms/liter, respectively. The estimated MATC is between 44.6 and 18.7 microgrsms/liter for the bluegill and between 18.0 and 7.5 micrograms/liter for the brook trout. The half-life of captan in Lake Superior water with a pH of 7.6 is about 7 hr at 12C and about 1 hr at 25C. Breakdown products from an initial 550 micrograms/liter of captan were not lethal to 3-month-old fathead minnows. (Holoman-Battelle)
W74-06085

INFLUENCE OF SALINITY ON PROTEIN REQUIREMENTS OF RAINBOW TROUT (SALMO GAIRDNERI) FINGERLINGS,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
I. H. Zeitoun, J. E. Halver, D. E. Ullrey, and P. I. Tack.
Journal of the Fisheries Research Board of Canada, Vol 30, No 12, Part 1, p 1867-1873, December 1973. 2 fig, 5 tab, 24 ref.

Descriptors: *Nutrient requirements, Environmental effects, *Salinity, *Proteins, *Rainbow trout, *Juvenile fish, *Fish diets, Fry, Mortality, Stress, Vitamins, Mineralogy.
Identifiers: Salmo gairdneri.

Rainbow trout (Salmo gairdneri) juveniles maintained at 10 and 20 ppt salinity were fed seven diet treatments from 30 to 60 percent protein in 5 percent increments for 10 weeks. The fish were stocked in cones, initially 50 fish per cone. Biweekly weights of diets and fish were determined and mortality was recorded daily. Percent-

age weight gain, gross diet efficiency, and protein efficiency ratio (P.E.R.) were computed. The minimum protein levels required for fish to achieve highest performance using these criteria were 40 and 45 percent for those maintained at 10 and 20 ppt, respectively. Mortality was significantly (P less than 0.05) higher for fish maintained at the higher salinity. Analyses of the fish carcasses were conducted at the beginning and end of the experiment on representative samples to estimate the grams protein retained and apparent net protein utilization (N.P.U.) to verify the above findings. All the available data showed that dietary protein was of major consequence on all measurements until the minimum required level of protein in the diet was reached, while salinity was of minor consequence. P.E.R. and apparent N.P.U. were 2.10 and 34.4, respectively, for casein diets at the 40 percent protein level. (Holoman-Battelle)

Descriptors: *Sessile algae, *Periphyton, Streams, *Growth rates, *Water pollution effects, Standing crops, Plant growth, Detergents, *Carbonates, Water quality, Oligochaetes, Alkalinity, Aquatic algae, *Bicarbonates, *Sodium compounds, Cyanophyta, Chlorophyta, Canada, Hardness(Water), Calcium, Dissolved oxygen, Nitrogen, Nitrates, Phosphates, Hydrogen ion concentration, Chrysophyta, Caddisflies, Diatoms, Biomass.
Identifiers: Sodium bicarbonate, Trichoptera.

Because a number of detergent manufacturers are contemplating substituting carbonate or bicarbonate derivatives for detergent phosphate a study of the effects of bicarbonate on attached algae in a small stream was undertaken. Additions of less than 50 mg/liter sodium bicarbonate significantly increased algal standing crop on glass slides exposed in the treated portion of a small stream during a 2-month period. Filamentous green algae dominated the periphyton community of both bicarbonate treated and control slides when the study was terminated after 63 days. A slight shift in species composition toward the Cyanophycea on the bicarbonate treated slides was also noted. Periphyton biomass increased continuously for the first 3 weeks and this increase was slightly more rapid on the treated slides. After the 4th week, biomass suddenly declined due to a dense 'infestation' of the oligochaete, Stylaria lacustris which often contained algal cells, largely diatoms, in its gut. As the filamentous green algae began to dominate the community on the slides, the number of Stylaria decreased. By the end of the 2nd month a trichopteran larva, Lepidostoma sp., became abundant and algal standing crop again sharply dropped. It dropped more precipitously on the treated slides during these infestations due to higher invertebrate densities there. (Mortland-Battelle)

THE HETEROTROPHIC CAPABILITIES OF CYCLOTELLA MENEGHINIANA,
Hartford Univ., Conn. Dept. of Biology.
J. C. Lylis, and F. R. Trainor.
Journal of Phycology, Vol 9, No 4, p 365-369, December 1973. 4 tab, 21 ref.

Descriptors: *Cultures, *Diatoms, *Light intensity, *Nutrient requirements, *Absorption, Bioassay, Organic matter, Growth rates, Diurnal.
Identifiers: *Heterotrophy, Cyclotella meneghiniana, Pinnularia, Eunotia, Gomphonema parvulum, Navicula motha, Nitzschia palea, Glucose, Culture media, Substrate utilization.

Studies were conducted to determine which organic compounds would support the growth of freshwater diatoms and to determine under what light conditions such organic compounds would support growth. Twenty-five compounds were tested with Cyclotella meneghiniana, Pinnularia sp., Eunotia sp., Gomphonema parvulum, Navicula motha, and Nitzschia palea. Pinnularia grew in the dark when glucose or fructose was added. Eunotia, Gomphonema, Navicula, and Nitzschia did not grow heterotrophically. Cyclotella meneghiniana grew heterotrophically in darkness when glucose in concentrations from 5 mg/liter to 10 g/liter was provided. The other compounds tested did not support growth. However, in continuous light (300 ft-c) growth was not enhanced if glucose was provided. Under diurnal conditions of light (300 ft-c) approximately 12-14 hr of darkness were required to observe the enhancement effects of glucose. Uptake studies with labeled glucose indicated that uptake is not dependent on glucose, but that it occurs only at low light intensities. Cells required 12-14 hr of darkness to develop the uptake system. (Little-Battelle)

EFFECTS OF EGG CONCENTRATIONS OF DDT AND DIELDRIN ON DEVELOPMENT IN WINTER FLOUNDER (PSEUDOPLEURONECTES AMERICANUS),
Massachusetts Univ., Amherst. Dept. of Forestry and Wildlife Management.
R. M. Smith, and C. F. Cole.
Journal of the Fisheries Research Board of Canada, Vol 30, No 12, Part 1, p 1894-1898, December 1973. 1 fig, 1 tab, 8 ref.

Descriptors: *Water pollution effects, *Fish eggs, *DDT, *Dieldrin, Bioassay, Mortality, Pesticide residues, Pesticide toxicity, Fish reproduction, Fish physiology, Marine fish, Insecticides, Chlorinated hydrocarbon pesticides, Lethal limit, Laboratory tests, Animal pathology, Fish diseases, Fertilization, Chemical analysis.
Identifiers: *Winter flounder, *Embryonic development, Chemical concentration, Pseudopleuronectes americanus.

Abnormal gastrulation and a high incidence (mean equals 39 percent) of vertebral deformities at hatching were encountered in developing eggs from winter flounder, Pseudopleuronectes americanus, experimentally exposed as adults to sublethal concentrations of DDT. Bone erosion and hemorrhaging at the vertebral junctures were often observed in conjunction with the vertebral deformities. No abnormal gastrulation and a lower incidence (mean less than 1 percent) of vertebral deformities without bone erosion and hemorrhaging were encountered in controls. DDT concentrations in the eggs ranged from 0.39 to 4.60 (mean equals 2.42 ppm) compared to 0.11-0.57 ppm (mean equals 0.22 ppm) in the eggs from control flounder. No observable effect on development was noted in eggs from adults exposed experimentally only to dieldrin except in two lots of eggs most of which were dead and necrotic at spawning and contained 1.74 and 1.21 ppm dieldrin. No direct effect on fertilization mortality was due to gamete concentrations of DDT and dieldrin and no residues of either insecticide were detected in the milt from exposed or control male flounder. THERMAL DEATH OF A HYDROCARBON BACTERIUM IN A NONAQUEOUS FLUID,
Florida State Univ., Tallahassee. Dept. of Oceanography.
M. M. Severance, and P. A. LaRock.
Journal of Bacteriology, Vol 116, No 3, p 1287-1292, December 1973. 4 fig, 1 tab, 14 ref.

Descriptors: *Thermal stress, *Temperature, Age, *Bacteria, Aqueous solutions, Cultures, Aging(Biological), Lipids, Laboratory tests, Testing procedures, Mortality, *Oil-water interfaces.
Identifiers: *Hydrocarbon-oxidizing bacteria, Survival, Brevibacterium, Enumeration, Hexadecane, Octanol, Mineral oil, Octane, Dodecane, Kerosene.

A hydrocarbon-utilizing Brevibacterium which grew into the oil phase of an oil-water system was tested for survival at elevated temperature. Cells suspended in oil and cells that had been resuspended in aqueous solution were tested by placing 1-ml samples of the cell suspension in small test tubes immersed in a controlled-temperature water bath. The resultant survival curves in oil consisted of two parts, a flat shoulder obtained in the first half of the heating period, followed by a break indicating rapid die-off. The break in the curves occurred after 50 percent of the cells were killed. This occurred at exposures of 25, 14, and 8 min for 78, 88.6, and 96.2 C, respectively. The survival curve for 63.5 C in the aqueous solution was a rapid, exponential die-off. The actual increase in survival of the organism in oil reflected by the length of the shoulder portion. The shoulder occurs only in an oil medium and is increased by decreasing temperature and increasing age of the culture. (Holoman-Battelle)

CRITERIA FOR ESTIMATING LIMITING NUTRIENTS IN NATURAL STREAMS,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
J. C. O'Shaughnessy, and A. J. McDonnell.
Available from the National Technical Information Service as PB-230 705; $7.75 in paper copy, $1.45 in microfiche. Pennsylvania Institute for Research on Land and Water Resources, University Park, Research Publication 75. December, 1973. 91 p, 24 fig, 7 tab, 57 ref. OWRR A-020-PA(2). 14-31-0001-4038.

Descriptors: *Eutrophication, Nutrients, Aquatic plants, Aquatic algae, *Phosphorus, *Nitrogen, *Bioassays, Sediments, Water pollution, Water quality standards, *Algae, Absorption.
Identifiers: *Nutrient limits, *Macrophytes.

The aquatic macrophytes Elodea canadensis and Potamogeton crispus, Callitriche sp.; and the algae Cladophora sp., Nitella flexilis, Oscillatoria sp., and Microspora sp. were tested for their NH+ -N absorption rate, alkaline phosphatase enzyme activity, extractable surplus phosphorus content, and nitrogen and phosphorus tissue content. Comparisons of the nutritional level of the test species were made with corresponding levels of nitrogen and phosphorus monitored in streamwater, adsorbed on stream sediments, and in the interstitial water of the sediments. Corrsponding laboratory cultures were maintained with media sufficient or depleted in nutrients. Study sites selected included stream segments receiving both natural and man derived inputs of nutrients and included levels of phosphorus ranging from low baseline concentrations to high levels imparted by discharges from secondary sewage treatment plant effluents. Nitrogen depression for the samples studied occurred at ammonium uptake rates ranging from 15 to 40 mg NH4+ -N/10 mg plant material/hr. Severe phosphorus limitation was exhibited at levels of extractable surplus phosphorus less than 0.06 to 0.08 mg PO4-P/100 mg plant material; with cellular phosphorus contents less than 0.13 to 0.20 percent and alkaline phosphatase enzyme activities greater than 1,000 enzyme units/mg plant material. Algae became phosphorus limited at streamwater soluble orthophosphate concentrations of less than 0.01 mg PO4-P/l. Aquatic macrophytes, using sediment interstitial water phosphorus as their primary

nutrient source, did not exhibit similar limitations at these levels.
W74-06105

THE BIOLOGY OF GAMMARUS (CRUSTACEA, AMPHIPODA) IN THE NORTHWESTERN ATLANTIC, VII. THE DURATION OF EMBRYONIC DEVELOPMENT IN FIVE SPECIES AT VARIOUS TEMPERATURES,
Memorial Univ. of Newfoundland, St. John's. Dept. of Biology.
D. H. Steele, and V. J. Steele.
Canadian Journal of Zoology, Vol 51, No 9, p 995-999, September 1973. 2 fig, 2 tab, 17 ref.

Descriptors: *Water temperature, Animal growth, Time, *Thermal stress, Life cycles, *Embryonic growth stage, *Reproduction, Amphipoda, *Crustaceans, Life history studies, Biology, Atlantic Ocean.
Identifiers: Embryonic development, *Gammarus, Beach fleas.

The duration of embryonic development in Gammarus duebeni, obtusatus, setosus, lawrencianus, and oceanicus at various temperatures was found to be related to the reproductive cycle. Slowest development at any temperature occurs in G. setosus, which breeds in September and whose young hatch in the next spring; G. duebeni, obtusatus, and oceanicus mate in late autumn and their young are hatched in the next spring; they have a faster rate of development. G. lawrencianus has the fastest rate of development at any temperature; it breeds in January and the young hatch in the spring. The rate of development is correlated with the size of egg. INTERACTIONS BETWEEN DDT AND RIVER FUNGI. II. INFLUENCE OF CULTURE CONDITIONS ON THE COMPATIBILITY OF FUNGI AND P,P'-DDT,
Leicester Polytechnic (England). School of Biology.
M. Hodkinson, and S. A. Dalton.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 6, p 356-359, December 1973. 2 tab, 9 ref.

Descriptors: *Fungi, *Bioassay, *Cultures, *DDT, *Growth rates, Pesticide toxicity, Water pollution effects.

Saprolegnia sp., Isoachlya monilifera, Isoachlya sp., Pythium sp., Clavariopsis aquatica, Heliscus submersus, Tetracladium setigerum, Varicosporium elodeae, Auroebasidium pullulans, Cephalosporium acremonium, Cladosporium cladosporioides, and Cylindrocarpon orthosporium were cultured in orbital shakers to study the interaction of DDT with the fungi and the influence of culture conditions on their compatibility. Samples were cultured from 24-1600 hrs at 5 or 10C with 2, 10, 20, or 60 micrograms DDT/ml. In general, the growth rates of the twelve fungi were enhanced when the insecticide was included in the basal medium. However, only 50 percent of the fungi were sensitive to 2 micrograms/ml of DDT, and of these, half responded after prolonged incubation. Normally 10 micrograms/ml and higher insecticide concentrations induced marked changes in fungal growth within 2 to 4 days at 20C. Incubation temperatures affected the growth rates of the fungi but did not alter their responses to the insecticide. The growth rate of each fungus increased with increased DDT concentration but the form of the growth curves remained the same. (See also W71-08686) (Little-Battelle)

PHYSIOLOGICAL RESPONSE OF THE MUD CRAB, EURYPANOPEUS DEPRESSUS TO CADMIUM,
National Marine Fisheries Service, Milford, Conn.
R. S. Collier, J. E. Miller, M. A. Dawson, and F. P. Thurberg.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 6, p 378-383, December 1973. 1 fig, 20 ref.

Descriptors: *Cadmium, *Water pollution effects, *Toxicity, *Lethal limit, Absorption, Mortality, Bioassay, Animal physiology, Oxygen, Laboratory tests.
Identifiers: *Mud crab, *Oxygen consumption, Median tolerance limit.

A study was undertaken to determine the toxicity of acute exposure of cadmium in the mud crab, Eurypanopeus depressus, as evidenced by mortality and by differential oxygen consumption occuring at non-lethal levels of this contaminant. Crabs were exposed to cadmium in one-gallon glass jars, filled to three liters with a synthetic medium prepared using technical-grade chemicals dissolved in fresh well-water and adjusted to 25 ppt salinity. The pH of the seawater remained at 7.0 for the range of cadmium concentrations tested. Analysis of the synthetic medium by an independent testing film indicated that cadmium was present at 0.0045 ppm and that other background metals were negligible. Oxygen consumption measurements were made on whole animals exposed to 0.0, 3.0, 6.0, and 7.0 ppm Cd (10-15 animals per concentration) and on excised gill tissue of animals exposed to 0.0, 4.0, and 7.0 ppm Cd (12 animals per concentration). Oxygen consumption was monitored over a 4-hr period in a Gilson differential respirometer. The LCO, LC50, and LC100 were 1.0 ppm, 4.9 ppm, and 11.0 ppm, respectively, with 95 percent confidence limits for the LC50 being 3.9-5.4 ppm. The oxygen consumption rates of whole animals showed great individual variation, ranging from 35 to 75 microliters oxygen/hr/g. Oxygen consumption rates of the gill tissue alone, however, decreased as the cadmium concentration increased. Because the whole animals exhibited great variations in oxygen consumption rates, no cadmium-induced changes could be detected. These variations were possibly due to differential activity between individual crabs, because they were held unrestrained and free to move about in the reaction vessels. Gill tissue oxygen uptake, however, showed a graded decrease with increasing cadmium, and may reflect tissue pathology. (Mortland-Battelle)

OXIDATION-REDUCTION POTENTIAL AND GROWTH OF SALMONELLA AND PSEUDOMONAS FLUORESCENS,
Iowa State Univ., Ames. Dept. of Food Technology.
J. L. Oblinger, and A. A. Kraft.
Journal of Food Science, Vol 38, No 7, p 1108-1112, November/December 1973. 6 fig, 2 tab, 13 ref.

Descriptors: *Oxidation-reduction potential, *Salmonella, *Pseudomonas, *Growth rates, Hydrogen ion concentration, Instrumentation, Measurement, Aeration, Metabolism, Cultures, Aerobic bacteria, Electrodes, Environmental effects, Pathogenic bacteria.
Identifiers: Survival, Enumeration, Agars, Culture media, Bacterial physiology, Serotypes.

An apparatus developed for measurement of changes in Eh, pH, and cell numbers was used to study pure and mixed cultures of Salmonella and Pseudomonas. Six serotypes of Salmonella and three strains of P. fluorescens were used. In all instances, cultures were incubated at the temperature that was to be employed during the experiments (24 hr at 30 and 37 C; 96-120 hr at 15 C) in trypticase soy broth. For pure culture studies at 15, 30 and 37 C, three or more vessels were inoculated with the particular Salmonella or Pseudomonas strain to yield approximately 100-1,000 cells per ml. For mixed cultures studied at 15 and 30 C, four vessels were inoculated with mixtures of selected Salmonella and Pseudomonas strains to yield varying initial ratios of Salmonella to Pseudomonas. During the pure culture investigations, trypticase soy agar (BBL) was used for enumeration of both Salmonella and Pseudomonas. For mixed culture enumeration, surface plating was used. Plates were incubated at either 15, 30 or 37 C, depending on the temperature used for cultivation. There seem to be definite values of Eh that determine if a given organism can initiate growth and/or survive. Measurements of Eh, pH, and growth at 15 C showed that, once the salmonellae investigated had adapted to the somewhat adverse environment, they possessed the capacity of proliferate actively and attain large populations. Moreover, the salmonellae and the Pseudomonas persisted for a longer time at 15 C than at 30 and 37 C. In the mixed culture studied, fewer cells per ml were produced by both the salmonellae and Pseudomonas strains than in pure culture. (Mortland-Battelle)

THE TOXICITY OF MIXTURES OF METALS AND SURFACTANTS TO RAINBOW TROUT (SALMO GAIRDNERI RICH.),
Istituto di Ricerca sulle Acque, Milan (Italy). Sezione Idrobiologia Applicata.
D. Calamari, and R. Marchetti.
Water Research, Vol 7, No 10, p 1453-1464, October 1973. 5 fig, 2 tab, 45 ref.

Descriptors: *Rainbow trout, *Toxicity, *Copper, *Mercury, *Detergents, *Water pollution effects, Mortality, Surface tension, Alkylbenzene sulfonates, Linear alkylate sulfonates, Lethal limit, Bioassay, Surfactants.
Identifiers: *Animal tissues, Nonylphenol ethoxylate, Synergistic effects, Standard Methods, Blood, Liver, Kidneys, Gills, Biological samples, Anionic detergents, Nonionic detergents, Mixtures.

The toxicity to rainbow trout of two metals (copper and mercury) and three detergents (two anionics and one non-ionic) were determined with an exposure period of 14 days. Each compound was tested separately and as a metal-detergent pair. The apparatus used for determining the toxicity of the mixtures semicontinuously changes the solution in the tank containing the fish. Ten randomly selected rainbow trout, 12-16 cm in length were used at each concentration. Before the experiments the animals were maintained for at least 7 days in running water of the same quality as that of the dilution water used in the test. Mortality was recorded every 3 h for the first 20 h, and then less frequently on successive days. The concentration of the anionic surfactants was checked daily by the methylene-blue method. A suitable analytical method was lacking for non-ionic surfactants (NP), so the volumes of toxic solutions and dilution water dispensed by the dosing apparatus were controlled rigorously. The concentrations of both

copper (cuproethyl method according to Standard Methods, 1960) and mercury (flameless atomic absorption) were checked daily along with the analyses of the other experimental conditions. The results show that for the mixtures of anionic detergents and metals a 'more-than-additive' effect exists, while for the mixture of non-ionic detergent and metal the toxic effect is probably 'less-than-additive'. These findings are compared with existing data in the literature and the underlying reasons for these effects are discussed. (Mortland-Battelle)

Descriptors: *Zooplankton, *Environmental effects, *Population, *Kansas, Daphnia, Density, Statistical methods, Calcium, Nitrites, Ammonia, Iron, Chlorides, Phosphates, Magnesium, Sulfates, Reproduction, Waterfleas, Competition, Water pollution effects, Food abundance, Regression analysis, Strontium, Boron, Zinc, Carbonates, Silicon, Conductivity, Temperature, Bicarbonates, Chlorophyll, Oxygen, Cobalt, Niches, Habitats, Dominant organisms, Biological communities.
Identifiers: Manganese, Ovigerous females, Photoperiod, Chlorophyll a, Data interpretation, *Daphnia ambigua.

Statistical relationships of 27 environmental components with population units of D. ambigua were determined for fifty weeks in a pond in northeastern Kansas. Simultaneous analyses accounted for more variability in total number/l and in the number of ovigerous females/l than did any of the lag analyses; 1-week lag accounted for the greates amount of variability in clutch size. Calcium was the most important variable determining density of Daphnia. Temperature and chlorophyll a (as a measure of food) were relatively unimportant in affecting total number. Other environmental components accounting for at least 2 percent of the variation in no lag were nitrite, ammonia, iron, chloride, phosphate, magnesium, sulfate and manganese. Temperature and boron were the most important variables affecting the number of egg-bearing females/l. Boron, nitrate, chloride, and strontium were the most important variables affecting clutch size. Food apparently affected clutch size in a minor way. The environmental components affect Daphnia ambigua and Diaptomus pallidus in quite different ways. These differences may prevent either species from maintaining dominance and excluding the other and could account for the widespread pattern of co-occurrence of diaptomid and daphnid species. MUSSELS AND INDICATORS OF BIOLOGICAL RECOVERY ZONE,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
G. M. Simmons, Jr., and J. R. Reed, Jr.
Journal Water Pollution Control Federation, Vol 45, No 12, p 2480-2492, December 1973. 9 fig, 2 tab, 36 ref.

Descriptors: *Water pollution effects, *Bioindicators, *Acid mine water, *Mussels, Water analysis, Mine drainage, *Virginia, Water quality, Flow rates, Dissolved oxygen, Hydrogen ion concentration, Scuba diving, Sampling, Water temperature, Dissolved solids, Benthic fauna, Suspended solids, Gastropods, Mayflies, Caddisflies, Stoneflies.
Identifiers: *Species diversity index, North Anna River(Va), Pamunkey River(Va), Recovery, Macroinvertebrates.

A 3-month study was made on the lower North Anna and upper Pamunkey River system in Virginia to locate the biological recovery zone of the North Anna River from the effects of acid mine drainage on Contrary Creek. The study included the collection of physical, chemical, and biological information (macrobenthos and fish). Physical and chemical information did not reveal any differences between water quality in the North Anna and Pamunkey rivers. Aesthetically and chemically speaking, the river recovers very quikly. The waters of the North Anna River below the entrance of Contrary Creek were also suitable for agricultural purposes such as irrigation and livestock watering. The insect portion of the macrobenthic community would indicate that, biologically speaking, the river recovered very quickly. However, if the entire macrobenthic community is considered, the river recovered at the confluence of the North Anna and South Anna rivers, that is, at the beginning of the Pamunkey River. The point of recovery is based on the re-establishment of mussel populations. Diversity indexes, because of the dominance of insect species, did not reveal the recovery zone. It is important, therefore, when one considers problems of this nature, to use as many components of the biological community as possible. Although diversity indexes were unable to show the recovery zone, the Sequential Comparison Index, originally proposed as a tool for nonbiologists, was just as reliable as the diversity index based on Information Theory with regard to placing an index number on a given community in a given location of the river. Scuba diving proved to be a very useful tool. Without this equipment the authors would never have been able to locate the biological recovery zone so precisely. (Little-Battelle)

NUTRIENT-PRODUCTIVITY RELATIONSHIPS IN A BAYOU ESTUARY,
General Electric Co., Bay Saint Louis, Miss. Mississippi Test Support Dept.
R. P. Hannah, A. T. Simmons, and G. A. Moshiri.
Journal Water Pollution Control Federation, Vol 45, No 12, p 2508-2520, December 1973. 11 fig, 2 tab, 29 ref.

Descriptors: *Nutrients, Ammonia, *Nitrites, *Nitrates, *Phosphates, Silts, *Ion exchange, Absorption, *Primary productivity, Limiting factors, Water analysis, Water pollution effects, Light, Water temperature, Salinity, Dissolved oxygen, Photosynthesis, Chemical analysis, Bayous, *Florida, Cycling nutrients, Radioactivity techniques, Phytoplankton, Distribution, Spatial distribution.
Identifiers: *Bayou Texa(Fla), Sample preservation, Buffering, Carpenter's Creek.

The temporal and spatial distribution of nitrogen and phosphorus were studied in Bayou Texa, an estuarine bayou near Pensacola, Fla., as related to the major nutrient source and carbon fixation of the system. Studies were conducted from March 1971 to March 1972. At the time of sampling, light, temperature, salinity, and DO were measured. Water samples were filtered and frozen until analysis for ammonia, nitrite, nitrate, and phosphate. The sediment-water column phosphate exchange was studied by two basic experiments designed to demonstrate the absorption of phosphates on sediment particles and the phosphate buffering capacity of silt particles. Carbon fixation was measured by a modification of the C-14 method. Results showed that Carpenter's Creek was the primary source of all nitrogen forms except nitrite. There was a significant degree of phosphorus exchange between the water and bayou sediments, even though the phosphorus content of the bayou was very low. Carbon fixation rates ranged from 140 mg C/hr/cu m in the early fall to 10 mg C/hr/cu m in the winter. Finally, the tests indicated that the inorganic nitrates were more important than the inorganic phosphates in controlling carbon fixation rates. (Little-Battelle)

RESPONSE OF ANABAENA TO PH, CARBON, AND PHOSPHORUS,
Pennsylvania Univ., Philadelphia. Dept. of Civil and Urban Engineering.
J. D. Keenan.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 99, No EE5, p 607-620, October 1973. 6 fig, 4 tab, 37 ref.

Descriptors: *Carbon, *Phosphorus, *Eutrophication, *Anabaena, *Hydrogen ion concentration, Water quality, Phosphates, Photosynthesis, Respiration, Cultures, Manometers, Statistical methods, Bioassay, Aquatic algae.
Identifiers: *Orthophosphates, Factorial analysis, Culture media.

The objectives were to study roles of carbon and phosphorus in cultural eutrophication, and to investigate the observation that blue-green algal blooms are frequently associated with a pH greater than 8.4. These objectives were met by the manometric determination of rates of photosynthesis and respiration in the blue-green alga, Anabaena flos-aquae as functions of pH, total inorganic carbon, and orthophosphate. The photosynthetic rate was independent of carbon concentrations from 30 ppm Na2CO3-300 ppm Na2Co3. At pH values of 8.3 or less, photosynthetic rate is dependent upon pH and independent of P concentration. At higher pH values, the reverse is true. Respiration was independent of pH, carbon, and phosphorus. The association of blue-greens with alkaline pH values is related to an H(plus) effect and is independent of the ionic forms of carbon and phosphorus. (Mortland-Battelle)

CARBON AND NITROGEN AS REGULATORS OF ALGAL GROWTH,
Kentucky Univ., Lexington. Dept. of Civil Engineering.
E. G. Foree, and C. R. Scroggin.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil

Engineers, Vol 99, No EE5, p 639-652, October 1973. 9 fig, 3 tab, 15 ref, 2 append.

Descriptors: *Carbon, *Nitrogen, *Growth rates, Limiting factors, *Plant growth regulators, *Aquatic algae, *Algal control, Anabaena, Chlorella, Chlamydomonas, Cladophora, Nutrients, Phosphorus, Chemical oxygen demand, Ammonia, Nitrogen fixation, Sewage sludge, Absorption, Water quality, Incubation, Hydrogen, Oxygen, Carbon dioxide, Sewage effluents.
Identifiers: Continuous cultures, Anacystis, Batch cultures.

Continuous flow algal cultures were grown under three different growth conditions using secondary sewage treatment plant effluent as the growth medium. The only variable within each run was the hydraulic residence time. The concentrations of growth regulating nutrients were varied between the runs so that comparisons of the algal mass, composition, nutrient uptake, and genera could be made. The importance of CO2 availability for algal growth was also studied. The second phase of the study was a batch culture study in which the same growth medium was used as in Phase 1. The objective of Phase 2 was to investigate significant similarities and differences between continuous and batch culture growth under otherwise similar growth conditions. Carbon dioxide enriched conditions produced as much as 10 times the algal mass as CO2 deficient conditions. Algal blooms dominated by blue-green algae were found to be the result of a successional change from green to blue-green algae under CO2 enriched, nitrogen limited conditions. In the batch culture study algae exhibited a luxuriant nitrogen uptake. (Mortland-Battelle)

OYSTERS: RETENTION AND EXCRETION OF THREE TYPES OF HUMAN WATERBORNE DISEASE BACTERIA,
Army Medical Research Inst. of Infectious Diseases, Frederick, Md.
W. A. Janssen.
Health Laboratory Science, Vol 11, No 1, p 20-24, January 1974. 2 tab, 9 ref.

Descriptors: *Oysters, *Shigella, *Salmonella, *Retention, *Bacteria, Brackish water, Ultraviolet radiation, Human diseases, Water pollution effects, Vectors(Biological), Cultures, Pathogenic bacteria, Self-purification, Enteric bacteria, Aerobic bacteria, Water pollution effects.
Identifiers: *Francisella, *Excretion, Survival, Fecal coliforms, Agars, Culture media, Tularemia, Bacillary dysentery, Gastroenteritis.

Oysters experimentally contamined with bacteria which cause bacillary dysentery (Shigella flexneri), tularemia (Francisella tularensis), or gastroenteritis (Salmonella typhimurium) retained and excreted the organisms for markedly different time periods in artificial brackish water continuously decontaminated by ultraviolet light. Sh. flexneri appeared to be removed within 24 h; excreted organisms were not detected in the aquatic environment. F. tularensis was retained for at least 11 days; excretion of these organisms was detected for 9 days. S. typhimurium persisted in oysters for the entire 49 days of the experiment and were excreted in sufficient numbers to be detected for 14 days. These findings indicate that depuration, or 'self-cleaning', procedures currently in use for commercial oysters based on removal of fecal coliform bacteria within 48 h may be deceptive and ineffective in removing some human waterborne disease organisms. COMPETITIVE GROWTH OF SALMONELLA AND PSEUDOMONADS IN TETRATHIONATE ENRICHMENT BROTH,
Aarhus Univ. (Denmark). Inst. of Hygiene.
A. S. P. Gundstrup.
Health Laboratory Science, Vol 11, No 1, p 25-27, January 1974. 9 ref.

Descriptors: *Salmonella, *Pseudomonas, *Growth rates, *Completion, *Sewage, Cultures, E. coli, Incubation, Isolation, Bioindicators, Aerobic bacteria, Waste water treatment.
Identifiers: *Tetrathionate, Antagonism, Enrichment media, Cylinder-Plate method, Agars, Bacterial physiology, Culture media, Mixed cultures.

Isolation of specific bacteria such as pathogens, indicators of pollution, from mixed flora samples, as sewage and receiving water samples, implies the risk that the saprophytic flora will overgrow them during the enrichment procedure due to antagonism and competition for essential nutrients. As part of a current series of investigations on the occurrence of antagonism in enrichment media, this paper deals with the importance of the frequent occurrence of Pseudomonas aeruginosa in tetrathionate broth used for Salmonella enrichment of sewage receiving water samples. It was shown, by means of the Cylinder-Plate-Method, and by means of simultaneous cultivation of Salmonella and Pseudomonas aeruginosa together in tetrathionate broth, followed by differential counts of the two, that the Pseudomonas did not interfere with Salmonella growth, or vice versa, although E. coli was inhibited to such extent by Pseudomonas that they could not be detected after 24 h incubation. The fact that Salmonella and Pseudomonas are able to develop simultaneously in tetrathionate broth opens the possibility of killing two birds with one stone, namely to isolate both Salmonella and Pseudomonas from e.g., sewage samples by a tetrathionate enrichment followed by a separation of the two bacteria on selective Pseudomonas and Salmonella media respectively. BIOLOGICAL EFFECTS OF FENITROTHION IN THE DIET OF BROOK TROUT,
Fisheries Research Board of Canada, St. Andrews (New Brunswick), Biological Station.
D. J. Wildish, and N. A. Lister.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 6, p 333-339, December 1973. 5 tab, 8 ref.

Descriptors: *Pesticides toxicity, Fish, *Diets, *Brook trout, *Bioassay, *Fish behavior, *Water pollution effects, Insect control, Foods, Secondary productivity, *Canada.
Identifiers: *Fenitrothion, Elimination, Acetylcholinesterase.

Three experiments were conducted to assess the possible effects on brook trout of spraying forests in New Brunswick with fenitrothion to prevent spruce budworm damage. Experiment 1 was to determine the regurgitation threshold of fenitrothion in the diet. Experiment 2 was to determine spontaneous food partitioning by individual fish receiving food with and without fenitrothion added. Experiment 3 was to determine dry weight and acetylcholinesterase activity of the fish used in experiment 2. The threshold for tolerance of fenitrothion in the stomach of brook trout was 376 mg fenitrothion/kg of wet fish weight. Regurgitation occurred 3-24 hr after ingestion. After 4 weeks of feeding 10 mg fenitrothion/g food, the hierarchical pattern of the fish had reversed. Total, but not individual, gross conversion efficiency of food per tank was highest after 4 weeks feeding with 10 mg fenitrothion/g. In Experiment 3 the previously most dominant fish in Experiment 2 regained dominance in the new conditions after 3 weeks. AChE activity values demonstrate that enzyme activities increased to 56 percent from 17 percent that of controls 27 days after exposure to 10 mg fenitrothion/g food. At 1 mg fenitrothion/g food the depression of AChe activity was not associated with behavioural effects. The possibility that aquatic and terrestrial insects killed by fenitrothion may cause lethal or sublethal effects directly in salmonids has been shown to be unlikely. It remains possible that reductions in insect biomass may be of sufficient magnitude and persistence to significantly reduce ration and hence reduce salmonid production. (Little-Battelle)

TEMPERATURE AND THE TOXICITY OF CHROMATE AND ARSENATE TO THE ROTIFER, PHILODINA ROSEOLA,
Northwestern Univ., Evanston, Ill.
E. D. Schaefer, and W. O. Pipes.
Water Research, Vol. 7, No. 12, p 1781-1790, December 1973. 3 fig, 4 tab, 7 ref.

Descriptors: *Rotifers, *Toxicity, *Water temperature, Time, Animal physiology, Bioassay, Water pollution effects, Lethal limit, Growth rates, Invertebrates, Heavy metals, Animal growth, Reproduction.
Identifiers: *Chromates, *Arsenates, Median tolerance limit, Survival, *Philodina roseola, Eggs.

The rotifer, Philodina roseola, was exposed to toxic solutions of chromate and arsenate in a study of the interaction of time, temperature and TL sub m in bioassay procedures. The objective of the study was to determine the form of the time, temperature and toxicity relationships in order to provide a better basis for predicting 'safe' concentrations from short term bioassay data and to illustrate the effect of temperature upon both short term toxicity and 'safe' concentrations. One hundred twenty rotifers were used at each concentration for the short term bioassays. The cultures were placed in incubators held at the desired temperature. The life span bioassays were conducted in the same manner except they were begun with eggs instead of adults. In a lettuce infusion medium all specimens of Philodina roseola were killed in less than 2 days at 40C but some specimens lived long enough to reproduce at 38C. The rate of increase of Philodina roseola increased exponentially with temperature in the range, 15-35C, but its median life span decreases exponentially with temperature in the same range. The data presented support the hypothesis that (1) for short exposure times aquatic organisms can withstand higher concentrations of toxic materials at lower temperatures than at higher temperatures; (2) the longer the exposure time the less the effect of temperature upon the concentration of toxic material which will kill half of the test organisms; and (3) life span TL sub m values are independent of temperature. APPARATUS FOR CONTROL OF POISON CONCENTRATION IN TOXICITY STUDIES WITH FISH,
Water Pollution Research Lab., Stevenage (England).
F. S. H. Abram.
Water Research, Vol. 7, No. 12, p 1875-1879, December 1973. 4 fig, 1 tab, 8 ref.

Descriptors: *Fish, *Toxicity, *Automatic control, *Measurement, Water pollution effects, Instrumentation, Laboratory equipment, Bioassay,

Automation, Laboratory tests, Research equipment, Poisons.
Identifiers: Dosing apparatus.

In order to facilitate accurate maintenance of defined experimental conditions in studying the effects of water pollutants on fish, automatic apparatus is frequently used. The equipment described here provides an automatic delivery of poison solutions to 14 aquaria; single poisons can be added at constant concentrations or poisons can be mixed or delivered in fluctuating or alternating concentrations. The system used involves the filling and emptying of 500-ml measuring cylinders with water, simultaneously incorporating an appropriate quantity of poison from a concentrated stock-solution. The apparatus consists essentially of 14 perspex aquaria; each of 40-l. capacity, and each equipped with its own dosing unit. Each dosing unit consists of a 500-ml measuring cylinder with three tabulations near the base, the largest of which connects the cylinder to a 10-mm bore kinkingtube valve. The tee-piece of this valve is attached by 'Terry' clips to a duralumin bar which is reciprocated through a distance of one inch by a pneumatic cylinder at timed intervals; hence the measuring cylinder fills and empties with water in accordance with the movement of the bar and discharges its contents into one of the aquaria. The apparatus has been found to work reliably for long periods, with little maintenance apart from routine cleaning, and also with a satisfactory degree of accuracy. (Mortland-Battelle)

INCIDENCE OF, AND BELIEFS ABOUT, ONCHOCERCIASIS IN THE SENEGAL RIVER BASIN,
Central District Control, Bamako (Mali).
P. J. Imperato, and O. Sow.
Trop Geogr Med. Vol 23, No 4, p 385-389, 1971.
Identifiers: Ethnic groups, *Mali Republic(Sevegal River basin), *Onchocerciasis, Rivers, Simulium, Vectors, *Attitudes, *Human diseases(Blindness).

Local beliefs about onchocerciasis were studied among several ethnic groups in that section of the Senegal River basin which lies in the Republic of Mali. Traditionally, the signs and symptoms of the disease were viewed as separate and unrelated entities. Although a certain degree of knowledge exists about the seasonal distribution and biting habits of the vector and the relationship of water courses to blindness incidence, there is no awareness that Simulium flies transmit the disease.--Copyright 1973, Biological Abstracts, Inc.

A BACTERIOLOGICAL STUDY OF THE OYSTER BEDS AND SHELLFISH OF THE LAGOON OF OUALIDIA DURING 1970, (IN FRENCH),
Institut des Peches Maritimes du Maroc, Casablanca.
P. C. Beaubrun.
Bull Inst Peches Marit Maroc. 20 p, 91-108. 1972. Illus.
Identifiers: Bacteriological studies, *Escherichia-Coli, Lagoons, *Morocco(Oualidia Lagoon), *Oyster beds, Pollution, Salinity, Shellfish, Water pollution effects, Water temperature.

The lagoon is a narrow body of water near Safi separated from the sea by a narrow line of sand dunes. Determinations of water temperature, salinity and number of Escherichia coli per liter were made at 3 stations over a 12 mo. period. The main sources of pollution are identified as: the animal manure spread on the tomato fields near the lagoon; a campsite which is fully occupied during the June-Sept. vacation period; fishermen and others who camp along the beach; and from cattle grazing near the lagoon. Some E. coli may also be introduced into the lagoon with oysters planted into the lagoon from contaminated sources. The numbers of E. coli in oysters and mussels were determined throughout the year also. However only on a very small number of exceptional occasions did the coli-form level rise above the 'acceptable' level.--Copyright 1973, Biological Abstracts, Inc.

A PARASITIC SPOROZOAN OF CRASSOSTREA RHIZOPHORAE (GUILDING), (IN FRENCH),
Institut Scientifique et Technique des Peches Maritimes, Nantes (France).
M. Comps, H. Grizel, and G. Tige.
C R Hebd Seances Acad Sci Ser D Sci Nat. Vol 275, No 15, p 1693-1695. 1972. Illus.
Identifiers: *Crassostrea-Rhizophorae, Culture, Digestive glands, French Guiana(Montsinery River), Gills, Histology, Mantle, *Oyster populations, Spat, *Sporozoan parasites.

On the coast of French Guyana, principally in the Montsinery river, natural oyster populations belonging to the species C. rhizophorae occur. Within the framework of oyster culture in Guyana, surveys were conducted on the possible parasites of these oysters which were little studied. This survey involving live and fixed samples made it possible to identify the presence of nematopsidian spores. Histological examination confirmed the localizations. The dissemination of the spores in the oyster involves the phagocytes which carry them into the interstitial conjunctive tissue of the digestive gland of the mantle and branchiae. The spores are individual or grouped within the same cell in 2, 3, or 4. Because the rate of infestation in spat is low, the investigators did not observe any mortality directly or indirectly involving the nematopsidian spores.--Copyright 1973, Biological Abstracts, Inc.

PHYSICAL, CHEMICAL, AND BIOLOGICAL CHARACTERISTICS OF CONEWAGO LAKE DRAINAGE BASIN, YORK COUNTY, PENNSYLVANIA,
Geological Survey, Harrisburg, Pa.
A. N. Ott, J. L. Barker, and D. J. Growitz.
Pennsylvania Department of Environmental Resources Water Resources Bulletin No 8, August 1973. 96 p, 38 fig, 38 tab, 73 ref, 2 append.

Descriptors: *Lakes, *Pennsylvania, *Eutrophication, Nutrients, Water pollution sources, Reservoirs, Productivity, Limnology, Water pollution effects.
Identifiers: *Conewago Lake(Penn).

The Conewago Lake drainage basin is a small sparsely populated basin in the humid temperate region of the Piedmont Province in south-central Pennsylvania. It contains naturally fertile streams that maintain a moderately enriched manmade lake. The basin, underlain principally by diabase, is 42% forested, and the balance of the area is devoted to nonintensive agriculture. Although electrolyte concentrations differed widely between surface and subsurface waters in the basin, there were only minor differences in the proportions of the major cations in these waters, the diabase, and the soil. A similarity was found in the electrolyte content of the regolith groundwater and low-base streamflow. The small ratio of lake storage to drainage area results in the storage of direct runoff which dilutes the fertile low-base streamflow. This dilution by the lake is sufficient to classify the lake as mesotrophic or moderately enriched. (Knapp-USGS)

ENVIRONMENT, WATER AND SEDIMENTS OF CHRISTIANSTED HARBOR, ST. CROIX,
Caribbean Research Inst., St. Thomas, Virgin Islands.
M. Nichols, D. Grigg, A. Sallenger, R. vanEepoel, and R. Brody.
Virgin Islands Department of Health, Division of Environmental Health Water Pollution Report No 16, May 1973 (2nd printing). 166 p.

Descriptors: *Water pollution effects, *Harbors, *Virgin Islands, *Sedimentation, Erosion, Turbidity, Water pollution, Sewage, Coliforms, Aesthetics, Water quality.
Identifiers: *Christiansted harbor (VI).

At Christiansted, St. Croix, Virgin Islands, development has been historically linked to the harbor. The harbor is used for transportation, its floor is a local source of sand for construction, and its offshore reaches are a source of food. Its shores provide recreational beaches and sites for boat repair and berthing. Most harbor shores are stable. Attractiveness of some beaches is reduced by accumulations of marine grasses, by ledges of beachrock, abandoned boats, and by rubble washed from dredge fill. Erosion is locally active at Turquoise Beach and on shores of unstabilized landfill. Water quality varies from excellent in the western harbor and seaward reaches to poor in the eastern and inner parts. High turbidity is partly introduced by sewage and sediment discharge, but mainly generated by wave erosion of unstabilized

dredge soil. Although tidal exchange is insignificant, waters are rapidly flushed and mixed by the over-reef flow supplemented by wave motion. The bulk of the sewage discharge is dispersed outside of the reef and transported away from the harbor in the prevailing currents. However, with some combinations of wind and sea directions, a much larger fraction is swept back into the harbor. An estimated 46% of the harbor floor has been directly or indirectly disturbed by dredging. The harbor could be improved by holding pollution and disturbance to a low level locally. (Knapp-USGS)

NUTRIENT ENRICHMENT AND CONTROL REQUIREMENTS IN THE UPPER CHESAPEAKE BAY, SUMMARY AND CONCLUSIONS,
Environmental Protection Agency, Annapolis, Md. Annapolis Field Office.
L. J. Clark, D. K. Donnelly, and O. Villa, Jr.
August 1973. 24 p, append.

Descriptors: *Chesapeake Bay, *Eutrophication, *Nutrients, *Maryland, Water pollution control, Water pollution sources, Nitrates, *Nitrogen, Phosphates, *Phosphorus, Water pollution effects.
Identifiers: Baltimore(Md), *Susquehanna River Basin.

The upper portions of the Chesapeake Bay and its tidal tributaries are suffering from eutrophication problems. Water quality monitoring data collected between 1968 and 1971 show an upward trend in phosphorus levels and indicate that inorganic nitrogen may presently be the growth rate-limiting nutrient. In order to limit the maximum algal standing crop to 40 micrograms/liter chlorophyll a, total phosphorus and inorganic nitrogen concentrations should not exceed 0.12 mg/liter and 0.8 mg/liter, respectively. A dynamic estuary water quality model was used to ascertain the maximum allowable phosphorus and nitrogen loadings from the Susquehanna and from Baltimore to maintain these criteria for three different Susquehanna flow conditions (10,000, 30,000 and 50,000 cfs). For the two lower flow conditions a 70% reduction in the existing phosphorus load would be required from both the Susquehanna Basin and the Baltimore area. During the high flow condition a reduction of over 90% of the point source discharges in the Susquehanna must be realized to achieve the phosphorus criterion. Nitrogen is considerably less manageable in the Susquehanna basin than phosphorus, especially during higher flow periods. Nitrogen control may be a feasible alternative under extremely dry weather conditions, but concentrated slugs of nitrogen associated with storm water runoff would undoubtedly contravene the criterion because of the Bay's exceptionally long flushing time. EFFECT OF DDT ON TEMPERATURE SELECTION OF SOME SALMONIDS,
University of the Panjab, Lahore (Pakistan). Dept. of Zoology.
M. Y. Javaid.
Pak J Sci Ind Res. Vol 15, No 3, p 171-176. 1972. Illus.
Identifiers: Atlantic salmon, Brook trout, Cyanide, *DDT, Potassium, Rainbow trout, *Salmon, *Salmonids, Temperature, *Thermal acclimation, *Trout.

Treatment for 24 hr with sublethal doses of DDT, ranging from 2-200 ppb, resulted in shifts in temperature selection of 3 species of salmonids. In both the Atlantic salmon and brook trout, in general, low doses of DDT decreased the selected temperature, higher doses increased it. In rainbow trout exposure to DDT led to only an upward shift in selected temperature. A shock-response to cold temperatures of the gradient was observed in both the Atlantic salmon and brook trout at higher DDT concentrations, while the rainbow-trout exhibited a shock-response to warm temperatures. Exposure of Atlantic salmon to potassium cyanide doses, ranging from 1-200 ppb, resulted in a downwards shift in selected temperature which was dose-dependent. The ATP-uncoupler 2,4-dinitrophenol treatment was without any effect on temperature selection of Atlantic salmon. Apparently DDT-induced changes in the behavior of fish observed were due to interference by DDT with the thermal acclimation mechanism. Metabolic rate as the causitive factor in thermal acclimation mechanism was discussed.--Copyright 1973, Biological Abstracts, Inc.

SURVEY OF THE EFFECT OF ASHTON PAPER MILL EFFLUENT DISCHARGE ON THE WATER OF THE RIVER SEVERN,
Paper (London), Vol 179, No 4, p 179-180, Feb. 21, 1973. 2 fig, 1 tab.

Descriptors: *Pulp wastes, *Dissolved oxygen, Water pollution sources, *Waste water disposal, *Pollution abatement, Water pollution effects, *Estuaries, Rivers, Europe, Sulfite liquors, Discharge(Water), Waste water(Pollution), Industrial wastes, Pulp and paper industry, Mixing, Tides, Tidal waters, Effluents, Ultimate disposal, Waste disposal, Surveys, Waste dilution.
Identifiers: *Severn River(England), Ashton Paper Mill Ltd.(U.K.), England, Spent sulfite liquors, White water.

Studies were conducted to ascertain the effect of the effluent from an integrated pulp and paper mill (Ashton Paper Mill Ltd.) on the quality of the Severn River. The mill utilizes the tidal pattern of the river to control effluent discharge times. Paper machine white water is discharged continuously, but the spent sulfite (or neutral sulfite) pulping liquor is ponded during an incoming tide and discharged immediately after high tide. Aerial and surface surveys confirmed rapid mixing of the effluent with the estuary water, owing to the strong tidal action. Although the discharge has a relatively high BOD, no significant effect on the dissolved oxygen content of the river is discernible. (Witt-IPC)

HEPATIC TUMORS IN THE GUPPY (LEBISTES RETICULATUS) INDUCED BY AFLATOXIN B1, DIMETHYLNITROSAMINE AND 2-ACETYLAMINOFLUORENE,
Tokyo Univ. (Japan). Dept. of Molecular Oncology.
S. Sato, T. Matsushima, N. Tanaka, T. Sugimura, and F. Takashima.
Identifiers: *Aflatoxin B-1, Carcinogens, *Fluorenes, Granulomatous, Guppy, Kidney, *Lebistes-Reticulatus, Lesions, Mesenteric, Nitrosamine, Sarcoma, *Toxins(Fish), *Tumors(Hepatic), Water pollution effects.

Guppies (Lebistes reticulatus) were fed 0.6 mg aflatoxin B1, 480 mg dimethylnitrosamine, or 30 mg 2-acetylaminofluorene/100 g powdered diet for several months. These carcinogens induced hepatic damage, hyperplastic nodules, and tumors of the liver, together with damage and tumorous lesions of other organs. Among fish receiving aflatoxin B1, 2 of 5 had hepatic tumors after 9 mo. and 6 of 11 after 11 mo. Hepatic tumors were found after 13 mo. in 2 of 20 fish given dimethylnitrosamine. The latter also had granulomatous kidney lesions and leiomyosarcoma in the mesentery. With 2-acetylaminofluorene, 1 of 3 fish developed hepatic tumors after 11 mo. and 3 of 13 fish after 13 mo. Carcinogenesis in a small fish such as the guppy provides a suitable model for simplifying carcinogenic experiments and the possibility of use of these fish to screen environmental carcinogens is discussed.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF ACID MINE DRAINAGE ON THE STREAM ECOSYSTEM OF THE EAST FORK OF THE OBEY RIVER, TENNESSEE,
North Carolina Wildlife Resources Commission, Elizabethtown.
L. E. Nicholas, Jr., and F. J. Bulow.
J Tenn Acad Sci. Vol 48, No 1, p 30-39, 1973. Illus.
Identifiers: *Acid mine drainage, *Chironomus, Ecosystem, *Euglena-Mutabilis, *Mine wastes, Rivers, *Sialis, Streams, *Tennessee(Obey River), Water pollution effects, Aquatic plants.

The stream ecosystem of the East Fork of the Obey River, Tennessee was studied from Jan. through Dec. 1970. Emphasis centered on water quality, macroinvertebrates, fish and aquatic flora affected by acid mine drainage. Two control stations were established within the study area, one above the pollution zone and the other below the zone of pollution. A reservoir station was established to detect any neutralization occurring within Dale Hollow Reservoir below the confluence of the East Fork and West Fork. An area approximately 40 miles in length was severely degraded by acid mine drainage. Limited macroinvertebrate populations existed within this region. Chironomus and Sialis were the predominate benthic indicator organisms present in the polluted zone. Euglena mutabilis was the most abundant representative organism of the aquatic flora. This organism was characteristic of acid mine pollution. Fish were recovered above and below, but not within, the zone of pollution. Fish recovered were characteristic of the type of habitat in which they were collected, being either typical stream or reservoir fish. A fish kill occurred in the East Fork embayment of Dale Hollow on Aug. 15, 1970 from acid mine drainage discharged upstream.--Copyright 1973, Biological Abstracts, Inc.

SEASONAL CHANGES IN ORGANIC NITROGEN CONTENT OF NET-AND NANNOPHYTOPLANKTON IN TWO HARDWATER LAKES,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
B. A. Manny.
Arc Hydrobiol. Vol 71, No 1, p 103-123. 1972.
Identifiers: Algal, Cell, Hard water, Lakes, *Nannoplankton, *Organic nitrogen, *Phytoplankton, Pigments, Plankton, Seasonal, *Productivity.

Seston at 1 m depth in 2 lakes representing extremes of hard water productivity was fractionated weekly for 14 mo. using 10 micro m Nitex netting. Net and anno fractions were analyzed by micro-Kjeldahl digestion for organic N, by aceton extraction for algal pigments and microscopically for algal cell volume. Comparison of organic N content of the 2 fractions with algal cell volume of cells larger and smaller than 10 micro m maximum dimension supported the hypothesis that nannophytoplankton contain more organic N and pigments/unit cell volume than netphytoplankton most of the year. Apparently, nannophytoplankton smaller than 10 micro m maximum dimension are responsible for more synthesis of cellular organic N than netphytoplankton in hard water lakes.--Copyright 1973, Biological Abstracts, Inc.

STUDIES IN THE ANALYSIS OF METROPOLITAN WATER RESOURCE SYSTEMS, VOLUME VIII: SOME DATA AND METHODS FOR ANALYZING METROPOLITAN WASTEWATER RECLAMATION AND REUSE SYSTEMS,
Cornell Univ., Ithaca, N.Y.
P. J-Y. Yang.
Available from the National Technical Information Service as PB-230 435, $7.50 in paper copy, $1.45 in microfiche. Cornell University Water Resources and Marine Sciences Center, Technical Report No. 78, 1974. 139 p, 31 fig, 26 tab, 71 ref. OWRR C-3101(3684)(4), 14-31-0001-3684.

Descriptors: *Water reclamation, *Water reuse, Water resources development, *Cost analysis, Water treatment, *Waste water treatment, Water users, *Systems analysis, *Water demand, Reclaimed water, Standards, Water quality, Mathematical models, Optimization, Water management, Effluents, Tertiary treatment, Water requirements, Water supply.

This study reviews some data and proposes some mathematical models that may be used to plan or design metropolitan wastewater reclamation and reuse systems. Specifically, optimization models have been developed for analyzing a wastewater reclamation project involving both water supply and water quality problems. The design problem examined involves the determination of least cost wastewater and water treatment plant capacities that satisfy water quantity and quality requirements at each water reuse site and also the quality constraints imposed on the waste receiving stream. In addition to developing a means of defining and evaluating alternative design for water reclamation and reuse systems that meet a variety of water quantity and quality requirements, the study also investigates the extent that water can be treated for reuse as an alternative in achieving water supply and pollution control objectives. The procedure of system optimization based on separable linear programming and the SUMT algorithms has been presented. The sensitivity of the least cost solution to varying demands for industrial water, varying transport distances, varying BOD influent concentrations to the wastewater treatment plant, and varying effluent standards for the receiving stream are discussed. (See also W74-01784) (Yang-Cornell)

RECYCLING MUNICIPAL SLUDGES AND EFFLUENTS ON LAND.
Proceedings of Joint Conference of Environmental Protection Agency, Department of Agriculture, and National Association of State Universities and Land-Grand Colleges, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land Grant Colleges, Washington, D.C. 1973. 244 p.

Descriptors: *Waste disposal, *Waste water disposal, Water law, *Sludge disposal, *Recycling, Legislation, Federal government, Regulation, State governments, Landfills, Public health, Research and development, Water pollution control, *Water reuse, *Waste water treatment.
Identifiers: Land disposal(Wastes).

Discharge of municipal wastewater has resulted in water pollution and air pollution. The impact of water and air quality standards, the tremendous quantities of sludges produced, and the expenditure of physical and monetary resources for conventional methods of wastewater treatment have prompted a search for alternative methods. One such alternative method, which utilizes land resources, is known as Soils Treatment Systems (STS). While not a new technology, its prior use has lacked the in-depth evaluations required to assure that STS's are environmentally acceptable. A conference entitled 'Recycling Municipal Effluents and Sludges on Land' discusses technical and institutional procedures to effectively use the resources available within the EPA, USDA, and Universities for a cooperative and coordinated research, development, and demonstration program. LAND APPLICATION OF WASTEWATER WITH A DEMOGRAPHIC EVALUATION,
Environmental Protection Agency, Washington, D.C.
B. L. Seabrook.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Illinois: National Association of Universities and Land-Grant Colleges, Washington, D.C. p 9-24, 1973. 3 fig.

Descriptors: *Waste water disposal, *Water spreading, *Recycling, Sludge disposal, Waste disposal, Waste treatment, Spray irrigation, Artificial recharge, Irrigation, Water purification, Water pollution control, *Water reuse.
Identifiers: *Land disposal(Wastes).

Land application of wastewaters from community and industrial processing sources is practiced successfully and extensively in the United States and in many countries throughout the world. Among the major reasons were: to provide for supplemental irrigation water; the desirability of augmenting groundwater sources; excessive distances of suitable bodies of receiving waters or extraordinary cost to construct facilities to reach suitable disposal sites; economic feasibility, as contrasted with the cost of construction and operation of advanced or tertiary treatment facilities; inability of conventional treatment facilities to handle difficult-to-treat wastes. Present land application facilities generally are not 'stressing' the system. Many facilities are using effluent on a crop-need basis. Uses include irrigation of parks, golf courses, cemeteries, college grounds, street trees, highway median strips, sports grounds, ornamental fountains and artificial lakes. Wastewater effluents are also used to irrigate many types of crops, including grasses, alfalfa, corn, sorghum, citrus trees, grapes, and cotton. Forest lands are also being irrigated in many areas. Groundwater augmentation to prevent salt water intrusion is being practiced. In Mexico, a wide variety of truck garden crops has long been irrigated with effluent. Crops appeared to benefit from both the nutrients and the increased amount of water which is applied. (See also W74-05963) (Knapp-USGS)

SOME EXPERIENCES IN LAND ACQUISITION FOR A LAND DISPOSAL SYSTEM FOR SEWAGE EFFLUENT,
Muskegon County Board, Mich. Dept. of Public Works.
J. C. Postlewait, and H. J. Knudsen.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D.C., p 25-38, 1973. 2 fig.

Descriptors: *Sewage disposal, *Waste water disposal, *Recycling, *Land tenure, Waste treatment, Sludge disposal, *Michigan.
Identifiers: *Land disposal(Wastes), *Muskegon County(Mich).

Some of the experiences in implementing the Muskegon County Wastewater Management System in the areas of land acquisition and relocation are described. The considerations which must be addressed in early planning in connection with putting together large tracts of land including legal phases and the political acceptance are discussed. The advantages which can be derived from the well planning multiple usage that such a site is capable of providing include possible power generation, the incentives for industrial expansion in the proximity, improved wildlife population, recreational potential, and agricultural advantages. THE PROPERTIES OF SLUDGES,
National Environmental Research Center, Cincinnati, Ohio.
R. B. Dean, and J. E. Smith, Jr.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D.C., p 39-47, 1973. 2 fig, 8 tab, 33 ref.

Descriptors: *Sludge disposal, *Water spreading, *Recycling, Fertilizers, Nutrients, *Waste disposal, Irrigation, Waste treatment, Sewage treatment, Heavy metals, Sewage disposal.
Identifiers: *Land disposal(Wastes).

Sludge is a liquid containing contaminants removed from wastewater by physical biological, and chemical treatments. Although sludge contains solids, the problem of of its disposal is not primarily a solid waste problem; it is rather the problem of disposing of the water that is in close association with waste solids. The major part of the cost of sludge treatment and disposal is directly related to the water. Dewatering and drying sludge are expensive operations. Sludge contains the major plant nutrients, nitrogen, phosphorus, and potassium, at levels that are about one-fifth of those found in chemical fertilizers. The sludge that is sold for agriculture and horticulture is bought for its content of organic slow-release nitrogen and other organic matter that improves the physical properties of the soil. Heavy metals occurring in quantities that are significant to agriculture include zinc, copper, nickel, cadmium, mercury, and lead. Zinc and copper are essential micronutrients that are present in sludges at concentrations in excess of those present in soils. The long history of successful use of sludge as a soil amendment in agriculture indicates that the hazards are slight and probably are easily controlled by appropriate farm practices. CHARACTERISTICS OF MUNICIPAL EFFLUENTS,
Metcalf and Eddy, Inc., Palo Alto, Calif.

C. E. Pound, and R. W. Crites.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D.C., p 49-61, 1973. 12 tab, 19 ref.

Descriptors: *Waste water disposal, *Irrigation, *Recycling, Water spreading, Sprinkler irrigation, Water quality, Sewage treatment, Waste treatment, Waste water treatment, Water pollution control, *Water reuse.
Identifiers: *Land disposal(Wastes), Spray irrigation.

Physical, chemical, and biological characteristics of municipal wastewaters are discussed with respect to land application. Constituents of raw wastewater and effluents from four types of plants are included. These constituents are compared to those of acceptable irrigation waters and to the relative amounts of each that would normally be applied to the land. The most important physical characteristic of wastewater is its total solids content. The solids include floating, suspended, colloidal, and dissolved matter. The solids are important because they have a tendency to clog the soil pores and coat the land surface. The chemical properties of wastewater can be divided into three categories: organic matter, inorganic matter, and gases. The organic matter in wastewater is in the dissolved form as well as settleable solid form, and it is principally composed of proteins (40 to 60 percent), carbohydrates (25 to 50 percent), and fats and oils (10 percent). Other organic compounds, such as phenols, surfactants, and agricultural pesticides, are generally present in small quantities. Many of the inorganic compounds provide nutrients for the vegetation, but they also can be toxic to plants at certain concentrations. Wastewater may contain pathogenic organisms which cause diseases, such as salmonella gastroenteritis, typhoid and paratyphoid fevers, bacillary and ameobic dysentery, cholera, and infectious hepatitis. Pretreatment is required to remove the bulk of these microorganisms from the wastewater. Adequate disinfection requires complete and rapid mixing and minimum contact time. The presence of suspended solids hinders the process of disinfection; therefore, secondary effluent is more readily disinfected than primary effluent. (See also W74-05963) (Knapp-USGS)

A REGIONAL VIEW ON THE USE OF LAND FOR DISPOSAL OF MUNICIPAL SEWAGE AND SLUDGE,
Environmental Protection Agency, Chicago, Ill. Region V.
R. J. Schneider.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D.C., p 63-66, 1973.

Descriptors: *Water Quality Act, *Federal Water Pollution Control Act, *Recycling, Conferences, *Sludge disposal, *Waste water disposal, Waste disposal, Water law, Water pollution control, Water reuse.
Identifiers: *Land disposal(Wastes).

Federal, State and local cooperative actions necessary to bring a municipal waste treatment project to completion are briefly discussed. New national water pollution control legislation challenges conventional methods and conventional thinking. It sets new requirements and goals. This workshop discussion is concerned with the particular challenge in the law with regard to finding land based alternatives for the handling of municipal wastewater. W74-05969

THE PHYSICAL PROCESSES IN THE SOIL AS RELATED TO SEWAGE SLUDGE APPLICATION,
Agricultural Research Service, Beltsville, Md.
E. Epstein.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D.C., p 67-73, 1973. 11 fig, 10 ref.

Descriptors: *Sludge disposal, *Soil disposal fields, *Recycling, *Soil physical properties, *Biodegradation, Soil chemistry, Hydraulic conductivity, Soil structure, Soil-water-plant relationships, Soil gases, Water reuse.
Identifiers: *Land disposal(Wastes).

Adding sewage sludge initially increases the hydraulic conductivity of a soil, but the conductivity later decreases. This decrease appears to be due to clogging of soil pores by microbial decomposition products. Soil structure affects soil water, soil air, mechanical impedence and root distribution. Organic matter, through the activity of microorganisms, increases soil aggregation. Sewage sludge application increased the stable aggregate 16% to 33%. The low oxygen and high carbon dioxide contents in the soil that result from high sludge application can reduce root growth, nutrient uptake and plant growth. Other gas products of decomposition, such as methane and etheylene, can be detrimental to plants. (See also W74-05963) (Knapp-USGS)
W74-05970

PHYSICAL CHANGES TO SOILS USED FOR LAND APPLICATION OF MUNICIPAL WASTE--WHAT DO WE KNOW, WHAT DO WE NEED TO KNOW,
Michigan State Univ., East Lansing.
A. E. Erickson.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 75-77, 1973.

Descriptors: *Sludge disposal fields, *Recycling, *Soil physical properties, *Biodegradation, Soil chemistry, Hydraulic conductivity, Soil structure, Soil-water-plant relationships, Soil gases, Water reuse.
Identifiers: *Land disposal(Wastes).

The physical changes in soils due to the application of municipal waste vary greatly depending on the kind of soil, type of waste, and quantity of waste applied. In coarse-textured, single-grained soils the sludge will condition the soil by its function as a surface active and water absorbing additive. The soil water properties are improved the water held at any tension is increased, and the soil nutrient sorption capabilities are increased. In fine-textured soils which are low in organic matter, sludge can supply the organic matter for the formation of a stable structure which could increase the infiltration and permeability, decrease the bulk density, increase the porosity, and improve the productive capacity. The amount of sludge used in most cases is more apt to be limited by the potential of the amended soil to leak nutrients than for them to be overloaded physically. In very bad situations where the physical problems are critical (such as mine spoil) large quantities of sludge produce the immediate physical soil improvement which is required for reclamation. Because sewage has more organic matter than effluent and is more biologically active, it is better soil amendment than effluent alone. The development of processes to remove the public health hazard of raw sewage would greatly improve systems which remove the BOD and concentrate other materials often to toxic concentrations, in the sludge. W74-05971

SOIL MICROBIOLOGICAL ASPECTS OF RECYCLING SEWAGE SLUDGES AND WASTE EFFLUENTS ON LAND,
Ohio State Univ., Columbus.
R. H. Miller.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 79-90, 1973. 7 fig, 50 ref.

Descriptors: *Sludge disposal, *Waste water disposal, *Recycling, *Soil microbiology, Path of pollutants, *Biodegradation, Nutrients, Trace elements, Heavy metals, Soil environment, Water pollution effects, Water reuse.
Identifiers: *Land disposal(Wastes).

The biological component of soil which includes bacteria, actinomycetes, fungi, algae and soil micro- and macroanimals makes significant contributions to waste recycling by decomposing organic compounds, eliminating some toxins, eliminating pathogenic microorganisms, and by influencing the solubility and mobility of inorganic ions. Present knowledge of these microbial reactions is reviewed and used to emphasize significant areas of needed research. Recycling sewage sludges on land will present different management problems from those associated with effluent recycling. Applications of anaerobically digested sewage at the rates presently being recommended for soils will result in a net accumulation of soil organic matter. Organic matter in soils is normally considered a valuable resource because of its influence on soil structure, water holding capacity, water permeability, cation exchange capacity, and adsorption of heavy metals. However, frequent large applications of sewage sludge or single massive applications could result in an accumulation of organic matter which would adversely affect ion solubility and availability, plant growth, or environmental quality. Application rates for both effluent and sewage should be based on the amount of mineralized nitrogen removed by the accompanying crop. Chemical fixation of orthophosphate by Fe, Al, Ca, and clay minerals in soil and removal by growing plants provide the primary mechanisms for restricting the mobility of phosphorus applied with effluents and sludges. (See also W74-05963) (Knapp-USGS)
W74-05972

INORGANIC REACTIONS OF SEWAGE WASTES WITH SOILS,
Colorado State Univ., Fort Collins. Dept. of Agronomy.
W. L. Lindsay.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 91-96, 1973. 1 fig, 13 ref.

Descriptors: *Sludge disposal, *Waste water disposal, *Soil disposal fields, *Heavy metals, *Trace elements, Path of pollutants, Ion exchange, Solubility, Recycling, Nutrients, Food chains, Landfills, Soil chemistry, Soil chemical properties, Water reuse.
Identifiers: *Land disposal(Wastes).

Sewage wastes decompose in soils to C02, water, residual soil organic matter, and inorganic constituents. The more soluble elements, which are generally Na, K, Ca, Mg, Cl, S04, N03, and H3B03, either remain in solution or exchange with ions on exchange sites on soil surfaces. Another group of elements, which include Zn, Cd, Pb, Cu, Ni, Cr, Hg, Mn, Co, P, As, Se, and Mo, from compounds and reaction products of intermediate solubility. Under many soil conditions these elements are sufficiently soluble that they are taken up by plants and cycled into the food chain of animals and man. Basic studies are needed to predict the long-term fate of potentially toxic heavy metals and other inorganic constituents that are

added to soils by the addition of sewage wastes. (See also W74-05963) (Knapp-USGS)
W74-05973

ORGANICS,
California Univ., Davis.
F. E. Broadbent.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 97-101, 1973. 1 fig, 3 tab, 5 ref.

Descriptors: *Sludge disposal, *Soil disposal fields, *Recycling, *Organic matter, Biodegradation, Nutrients, Soil structure, Humus, Decomposing organic matter, Water reuse.
Identifiers: *Soil organic matter, *Land disposal(Wastes).

The organic components of sewage sludge are partly undecomposed substances and partly microbial cells and by-products synthesized during the treatment process. Most substances in both categories are readily biodegradable and undergo extensive decomposition when incorporated in soils. Part of the sludge applied to soil becomes part of the soil humus after extensive modification, but most is converted to simple inorganic compounds. Sludge may contribute to soil improvement through its favorable effect on such soil properties as moisture holding capacity, structural stability, and cation retention. W74-05974

LAND TREATMENT OF LIQUID WASTE: THE HYDROLOGIC SYSTEM,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
H. Bouwer.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 103-111, 1973. 5 fig, 12 ref.

Descriptors: *Waste water disposal, *Water spreading, Soil disposal fields, *Path of pollutants, Water pollution control, Groundwater movement, Hydrology, Recharge, Soil water movement, *Recycling, *Water reuse, Waste water treatment.
Identifiers: *Land disposal(Wastes).

The main hydrologic factors to be considered in the design and operation of land treatment systems are (1) infiltration rates, (2) response of groundwater to infiltration, (3) effect of system design and management on quality of renovated water, and (4) control of underground spread of renovated water below the water table. Principles of controlling the spread of renovated water are presented for deep and shallow aquifers. Because the performance of a land treatment system for liquid waste depends so much on the local conditions of soil, climate, and hydrogeology, pilot systems should precede any large-scale development. LAND RESOURCES,
Soil Conservation Service, Washington, D.C.
K. W. Flach.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 113-119, 1973. 2 fig, 2 tab.

Descriptors: *Waste disposal, *Sludge disposal, *Recycling, *Water spreading, Hydrogeology, Land use, Soil properties, Waste water disposal, Irrigation, *Water reuse.
Identifiers: *Land disposal(Wastes).

Soil, climatic, geologic, and institutional factors have to be considered in selecting sites for waste disposal on land. Runoff, erosion, permeability, infiltration capacity, and available water holding capacity are important soil properties. The balance and distribution of precipitation and evapotranspiration are important climatic considerations, and lithology, jointing, and groundwater relationships are important geologic factors. Availability of public land and farm size must also be taken into account. Soil surveys conducted by the Soil Conservation Service of the United States Department of Argiculture and its cooperators can be used for evaluating the feasibility of disposal systems and for locating sites. Soils suitable for waste disposal are available near most metropolitan areas, but the ecological, economic, and institutional factors are most favorable in the arid western United States. W74-05976

SOIL-PLANT RELATIONSHIPS (SOME PRACTICAL CONSIDERATIONS IN WASTE MANAGEMENT),
Illinois Univ., Urbana.
S. W. Melsted.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 121-128, 1973. 1 tab, 27 ref.

Descriptors: *Sludge disposal, *Waste water disposal, *Recycling, *Soil-water-plant relationships, *Water reuse, Water pollution effects, Path of pollutants, Nutrients, Biodegradation, Heavy metals, Trace elements.
Identifiers: *Land disposal(Wastes), Spray irrigation.

Soil-plant relationships that may influence municipal sludge and effluent applications on land include nutrient mobility in the soil, ion absorption by plants, methods of determining plant composition through soil analysis, importance of sludge placement to ion absorption by crops, and nutrient absorption through foliar feeding. Monitoring problems, especially as related to soil or plant analysis, are discussed with plant analysis rated more practical at this time. Normal plant composition ranges and suggested tolerance levels for toxic heavy metals are given. Research recommendations meriting high priorities include (1) defining the available form of heavy metals, (2) correlation studies between soil levels and plant composition, (3) absorption of noxious compounds from foliar spray irrigation, (4) determination of residual nutrient levels in 'living filter systems' of effluent treatment, (5) determination of tolerance levles of toxic heavy metals permissible in feeds and foods and (6) determining disposal management systems that maximize the beneficial properties while minimizing the hazards from applying municipal sludges and effluents on land. (See also W74-05963) (Knapp-USGS)
W74-05977

CROP AND FOOD CHAIN EFFECTS OF TOXIC ELEMENTS IN SLUDGES AND EFFLUENTS,
Agricultural Research Service, Beltsville, Md.
R. L. Chaney.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 129-141, 1973. 15 tab, 45 ref.

Descriptors: Heavy metals, *Sludge disposal, *Water spreading, *Recycling, *Soil disposal fields, Cadmium, Cabolt, Chromium, Copper, Mercury, Nickel, Lead, Zinc, Toxicity, Path of pollutants, Water pollution effects, *Water reuse.
Identifiers: *Land disposal(Waters).

Sewage sludge and effluent are applied to soil with the intent that toxic elements be retained by the soil. These elements will accumulate and persist, and are the long-term environmental hazard in land application. Elements in sludge and effluent that are potential hazards to plants or food chains are: B, Cd, Co, Cr, Cu, Hg, Ni, Pb, and Zn. Accumulations of Cd, Cu, Zn, and Ni are related to the high phosphate and organic matter contents of sludge and effluent. There are numerous examples of metal toxicity in agriculture. Toxic amounts of Cu, Zn, or Ni have accumulated in soils from fungicides, unneeded fertilizers, and sewage sludge, or have occurred naturally. Most toxicities have occurred under intensive agricultural practices, such as orchards, vineyards, or vegetable fields, and can be quite expensive to alleviate. Toxicities to crops generally have occurred in unmanaged situations most favorable for toxicity: low pH, sandy soils, high metal sludges, and/or metal-sensitive crops. These toxicities have often been alleviated by liming to higher soil pH. (See also W74-05963) (Knapp-USGS)
W74-05978

CROP SELECTION AND MANAGEMENT ALTERNATIVES--PERENNIALS,
Pennsylvania State Univ., University Park.
W. E. Sopper.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 143-153, 1973. 10 tab, 10 ref.

Descriptors: *Irrigation water, *Waste water disposal, *Recycling, *Sprinkler irrigation, Grasses, Forests, Trees, Nutrients, Sewage disposal, Sludge disposal, Vegetation effects, *Water reuse.
Identifiers: *Land disposal(Wastes).

Perennial vegetation can be utilized as part of the land management system of a municipal wastewater disposal site. The use of perennials in the land management system of the disposal site may depend upon whether spray irrigation will be continued throughout the year or only operated during the warm summer growing season. If annual spray irrigation is contemplated, forests or perennial grasses may have to be used, particularly in the northern climates where temperatures drop and remain below freezing for prolonged periods of time. These vegetation types will normally provide better winter infiltration conditions because of the accumulation or organic matter which provides an insulation layer on the soil surface and reduces soil freezing. In addition, the acid conditions generally associated with forest soils provide a larger phosphorus adsorptive capacity. Perennial grasses appear to be suitable for wastewater disposal sites and have received the most attention. In general, they have fibrous root systems, are sod forming, which aids in erosion control and provides for high infiltration rates, are tolerant of a wide range of ecological conditions, have a long period of growth and have a high uptake of nutrients. (See also W74-05963) (Knapp-USGS)
W74-05979

RECYCLING URBAN EFFLUENTS ON LAND USING ANNUAL CROPS,
Arizona Univ., Tucson. Dept. of Agronomy and Plant Genetics.
A. D. Day.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 155-160, 1973. 19 ref.

Descriptors: *Irrigation water, *Waste water disposal, *Recycling, *Sewage disposal, Nutrients, Fertilizers, Crops, Crops response, *Water reuse, Soil-water-plant relationships.
Identifiers: *Land disposal(Wastes).

Because municipal wastewater contains more fertilizer elements (nitrogen, phosphorus, and potassium) than do most other forms of irrigation water, it offers an agricultural potential that should be exploited. High yields of food, feed, forage, oil, and fiber plant products may be obtained from crop plants utilizing municipal wastewater as a source of irrigation water and plant nutrients. Soil irrigated with wastewater had a lower infiltration rate, higher modulus of rupture, and more soluble salts, nitrates, and phosphates than did soil irrigated with well water and fertilized with suggested amounts of nitrogen, phosphorus, and potassium. Irrigation with wastewater (sewage effluent) for 14 years did not decrease field crop yields or result in any adverse effects on soil that could not be corrected with minor changes in field crop culture. W74-05980

ENGINEERING AND ECONOMICS OF SLUDGE HANDLING,
Bauer Engineering, Inc., Chicago, Ill.
W. J. Bauer.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 161-167, 1973. 1 fig, 2 tab.

Descriptors: *Sludge disposal, *Fertilizers, *Costs, *Recycling, Sludge treatment, Transportation, *Water reuse.
Identifiers: *Land disposal(Wastes).

For beneficial use of municipal sludges, there are a great number of possible combinations of sludge transportation and application schemes which can be developed. The range of costs from $37 to $52 per dry ton is relatively small. These costs are competitive with incineration. The transportation and land application systems are usually low in capital cost, and relatively more expensive in operating cost than would be the incinerators as long as the incinerators would not require repair. A cost of $50 per dry ton of sludge for disposal corresponds to less than two dollars per capita per year, as the sludge from roughly 30 persons amounts to about one dry ton per year. Possible differences in cost arising from alternative systems are even smaller. Considerations other than cost should determine the best use of this resource rich in organic material. (See also W74-05963) (Knapp-USGS)

RECYCLING MUNICIPAL SLUDGES AND EFFLUENTS ON LAND,
Williams and Works, Grand Rapids, Mich.
T. C. Williams.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973 , Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 169-173, 1973.

Descriptors: *Waste water disposal, *Sewage disposal, *Recycling, *Water spreading, *Irrigation water, Sprinkler irrigation, Soil disposal fields, Water reuse, Waste water treatment.
Identifiers: *Land disposal(Wastes).

The degree of pretreatment required for disposal of sewage on land varies depending upon the type of land treatment. For spray irrigation, treatment should be equivalent to the treatment for disposal of the liquid into surface water. For flood irrigation, perhaps treatment of a lesser degree is satisfactory. For grass filtration perhaps simple primary treatment is adequate. But on all of these, the question of public acceptance must be considered. To get public acceptance, the material put on to the land for further treatment should be at least as good as what goes into rivers except for the removal of nutrients. In the northern part of the United States, irrigation is impossible in the winter time. All of the wastewater that is generated during the winter season must be stored. Land availability and isolation are also related to the treatment. (See also W74-05963) (Knapp-USGS)
W74-05982

ECONOMIC ASPECTS OF THE APPLICATION OF MUNICIPAL WASTES TO AGRICULTURAL LAND,
Illinois Univ., Urbana.
W. D. Seitz, and E. R. Swanson.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 175-182, 1973. 5 fig, 1 tab, 22 ref.

Descriptors: *Waste water disposal, *Sludge disposal, *Recycling, Economics, *Cost-benefit analysis, Costs, Irrigation, Crops, Crop response, Crop production, *Water reuse.
Identifiers: *Land disposal(Wastes).

Minimizing the cost of waste treatment and of its disposal on agricultural land was analyzed. In the process of cost-minimization, account is taken of crop returns from application of waste and of environmental damage. The optimal rate of application of waste to crops is influenced by all variables and functions in the system, including the marginal cost of alternative methods of treatment and disposal. A simulation analysis of a particular land-reclamation sludge-disposal project is described. The variables most influential in performance of the system included transport costs for sludge, site preparation costs, assumptions regarding the nitrogen budget, choice of cropping system, and source of labor used in site preparation. W74-05983

MONITORING CONSIDERATIONS FOR MUNICIPAL WASTEWATER EFFLUENT AND SLUDGE APPLICATION TO THE LAND,
Michigan Dept. of Natural Resources, Lansing.
P. A. Blakeslee.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 183-198, 1973. 2 tab.

Descriptors: *Recycling, *Waste water disposal, *Sludge disposal, Water pollution, *Monitoring, Path of pollutants, Design, Planning, *Water reuse.
Identifiers: *Land disposal(Wastes).

Monitoring the performance of the many interrelated systems which are involved in applying wastewater or wastewater sludge to the land cannot be looked upon as a substitute for a full understanding of system response prior to project commitment. The role of an ongoing monitoring program should be to confirm judgments made at the design stage and where inadequate information is currently available to assure with reasonable certainty the nature of system response adequate safeguards must be provided. An overview is given of current effluent and wastewater sludge quality at Michigan municipal wastewater treatment plants. Guidelines being used in Michigan for groundwater monitoring associated with on-land disposal systems are presented. (See also W74-05963) (Knapp-USGS)

INSTITUTIONAL OPTIONS FOR RECYCLING URBAN SLUDGES AND EFFLUENTS ON LAND,
Metropolitan Sanitary District of Greater Chicago, Ill.
R. R. Barbolini.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Illinois: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 199-205, 1973.

Descriptors: *Recycling, *Sludge disposal, Fertilizers, *Planning, *Instututions, Governments, Land use, Economics, Institutional constraints, *Water reuse.
Identifiers: *Land disposal(Wastes).

Institutional options for recycling effluents and sludges from urban wastewater treatment plants on land include numerous alternative methods for financing, operating, and organizing large-scale programs. The effects of technical, social, political and legal constraints are significant in the determination of preferredalternatives. The experiences of the Metropolitan Sanitary District of Greater Chicago (MSDGC) are used to illustrate available institutional options. The MSDGC has been active in land application of sludge and is currently engaged in a very large-scale project to apply sludge to rural, stripmined land approximately 200 miles from the center of its collection and treatment activities. Preferred methods of financing are bond sales or State and Federal grants for capital improvements, and current taxation for normal maintenance and operation activities. The preferred alternate for operation of land application facilities the purchase of large rural tracts. Land development must be achieved through careful planning activities conducted with close cooperation between local government agencies of the rural receiving area and the urban producing area. There is an urgent need for State and Federal conceptual commitment, and financial and technical assistance to land application programs. (See also W74-05963) (Knapp-USGS)
W74-05985

PUBLIC ACCEPTANCE--EDUCATIONAL AND INFORMATIONAL NEEDS,
Purdue Univ., West Lafayette, Ind.
J. O. Dunbar.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Ill: National Association of State Universities and Land-Grant Colleges, Washington, D C, p 207-211, 1973. 3 ref.

Descriptors: *Recycling, *Sludge disposal, Fertilizers, *Planning, *Insutitutions, Public rights, Governments, Land use, Economics, Institutional constraints, Public health, Water reuse.
Identifiers: *Land disposal(Wastes), *Public acceptance.

For an idea such as recycling urban sewage and sludge to the land to be implemented in our society, it must have public acceptance. It must be acceptable to the majority of the people. It must be actively supported by a large enough number of individual leaders so that they can favorably inform the people who depend upon them and keep those who oppose it in the minority. It must have enough support by both private and public groups so that they will use their organizational, financial, and political strength to bring about its implementation. An educational and informational program helps win public acceptance. In order to use limited resources efficiently, such programs should be carefully thought through and analyzed. Necessary information should be developed and disseminated as quickly as possible. (See also W74-05963) (Knapp-USGS)

INACTIVATION OF POLIOVIRUS IN WATER BY OZONATION,
Maine Univ., Orono. Dept. of Civil Engineering.
S. B. Majumdar, W. H. Ceckler, and O. J. Sproul.
Journal Water Pollution Control Federation, Vol 45, No 12, p 2433-2443, December 1973. 9 fig, 2 tab, 10 ref.

Descriptors: Ozone, Waste water(Pollution), Mathematical studies, *Waste water treatment, *Viruses, Cultures, Water pollution, Continuous flow.
Identifiers: *Inactivation, Survival, *Polioviruses, *Ozonation, Batch cultures, Continuous cultures, Distilled water.

The objective of the present study was to delineate the basic mechanism of inactivation of poliovirus (Type 1) by ozonation. Specific investigations, including both batch and continuous flow experiments, were carried out to determine the rate equations of poliovirus inactivation with respect to contact time and ozone concentration in triple distilled water and primary and secondary wastewaters. The poliovirus was grown and harvested in LLC-MK2 (Hull) continuous monkey kidney cells. The concentration and purification procedure gave a suspension with a titer of about 10 to the 7th power to 10 to the 7.5 power plaque forming units (PFU)/ml with a chemical oxygen demand (COD) of about 8 mg/ml. Virus survival data in triple distilled water with ozone concentrations from 0.13 to 1.18 mg/l indicate that there was a sudden decrease in virus survival at about 1 mg/l of initial ozone concentration. The data for the primary and secondary wastewater continuous flow studies show that approximately the same amount of inactivation was obtained in primary and secondary wastewater under similar conditions of ozone residual and contact time. The data indicate that, in addition to ozone concentration, contact time is an important consideration for virus inactivation. A contact time of 4 min gave a higher inactivation compared with 2 min for the same initial ozone concentration. Generally speaking, the rate of disinfection is a function of four variables: (1) the contact time, (2) the concentration of the disinfectant, (c) the number of organisms, and (3) the temperature of the water. LUXURY UPTAKE OF PHOSPHATE BY ACTIVATED SLUDGE,
Notre Dame Univ., Ind. Dept. of Civil Engineering.
J. B. Carberry, and M. W. Tenney.
Journal Water Pollution Control Federation, Vol 45, No 12, p 2444-2462, December 1973. 24 fig, 3 tab, 29 ref.

Descriptors: *Waste water treatment, *Phosphates, *Absorption, *Activated sludge, Path of pollutants Biomass, Nutrient removal, Radioactivity techniques, Carbon, Phosphorus, Water quality, Statistical methods, Calcium, Ions, Solubility, Tracers, Cations, Cytological studies, Aeration, Chemical oxygen demand, Suspended solids, Hydrogen ion concentration.
Identifiers: 2 4-Dinitrophenol.

A series of experiments were performed to determine the mechanism of luxury uptake of phosphate by activated sludge. Solubility calculations and calcium ion analyses indicated that removal does not occur by chemical precipitation. Poisoning experiments using 2, 4-dinitrophenol, biomass extraction experiments, and experiments using radioactive tracers with cation supplements indicated that the phosphate removal occurred by a biological mechanism causing the phosphate to be transported across the cell membrane. The mechanism seemed to involve active transport because the biomass was able to concentrate phosphate in the cell. Certain monovalent cations seemed to control the transport. Carbon and phosphorus seemed to be transported independently. (Mortland-Battelle)

OZONE DISINFECTION OF INDUSTRIAL-MUNICIPAL SECONDARY EFFLUENTS,
Welsbach Ozone Systems Corp., Philadelphia, Pa.
C. Nebel, R. D. Gottschling, R. L. Hutchison, T. J. McBride, and D. M. Taylor.
Journal Water Pollution Control Federation, Vol 45, No 12, p 2493-2507, December 1973. 13 fig, 6 tab, 18 ref.

Descriptors: *Ozone, *Industrial wastes, *Municipal wastes, Effects, *Effluents, *Sewage bacteria, *Disinfection, *Waste water treatment, *Viruses, Water quality, Oxidation, Coloforms, Turbidity, Color, Dissolved oxygen, Flotation, Hydrogen ion concentration, Suspended solids, Nitrates, Phosphates, Chemical oxygen demand, Biochemical oxygen demand, Carbon, Fish, Froth flotation.
Identifiers: Ozonation, Fecal coliforms, Pollutant removal, Fecal streptococci.

A pilot study of ozonation of industrial-municipal secondary effluent has demonstrated that ozone can be used successfully as an alternative to chlorination for rapid disinfection and concurrent tertiary treatment. Ozone at a dosage of 15 mg/l was contacted with the effluent in a chamber baffled to provide an over-and-under flow path. Fecal coliforms were reduced to 103/100 ml, and total coliforms and fecal streptococci to 500 and 9/100 ml, respectively. The viruses not destroyed by secondary treatment were rapidly eliminated by ozonation. The process improved other effluent quality parameters (oxygen demand, turbidity, and color) by direct oxidation, and flotation. The ozonated effluent is nontoxic and high in dissolved oxygen, and resembles potable water in appearance. (Mortland-Battelle)

THE LONG LITTERED PATH TO CLEAN AIR AND WATER,
G. Bylinsky.
Fortune Magazine, Vol 82, p 112-115, 133-134, October, 1970.

Descriptors: *Federal government, *Waste treatment, *Pollution control, *Long-term planning, *Treatment facilities, Water pollution control, Water pollution effects, Water pollution sources, Water pollution treatment, Water purification, Water policy, Water management, Water conservation, Waste water treatment, Environmental sanitation, Industrial wastes, Municipal wastes, Waste water disposal, Water quality, Treatment, Sewage treatment, Chemical wastes, Water reuse, Watersheds, Marine life.

Cleaning up the country's air and water will be a much tougher, slower and costlier job than politicians and environmentalists sometimes contend. Enforcement of strict new legislation will speed up the process, but legislation and public pressures alone are not enough. Without advances in technology, the big clean-up can only plod along. There are serious lags in new pollution-control technology, as well as in the readiness of business, government and the public to encourage, apply and pay for technological improvements. In water pollution control, the great problem is excessive adherence to old methods rather than a lack of new ones. Two billion dollars of federal monies per year go into old-fashioned sewage treatment plants, which can not cope with today's complex chemical pollutants. Critics say the government should expand its meager regional-studies and research programs. They also recommend the construction of big sewage-treatment plants capable of handling waste from a large area. Pipelines for waste discharge could bypass the estuaries and spawning areas for much marine, life, and discharge the treated effluent far out at sea. Eventually, the answer is indefinite recycling and re-use of water. (Silber-Florida)

NITRIFICATION AND DENITRIFICATION FACILITIES,
Metcalf and Eddy, Inc., Boston, Mass.
H. E. Wild, Jr., C. N. Sawyer, and T. C. McMahon.
Available from NTIS, Springfield, Va 22151, PB-215 693, Price $3.00 printed copy, $1.45 microfiche. Contract Report prepared for Environmental Protection Agency, July 1971. 55 p, 22 fig, 1 tab, 11 ref.

Descriptors: *Nitrification, *Sewage treatment, Waste treatment, Sewage bacteria, Tertiary treatment, Denitrification, *Treatment facilities, *Waste water treatment.

A 10-gpm pilot nitrification unit, receiving settled high-rate trickling filter effluent, was operated open to the weather from October 1969 through April 1970. Studies on the influence of temperature and pH were made in the laboratory using return sludge from the nitrification unit and settled trickling filter effluent. The ammonia nitrogen concentration did not inhibit nitrification in concentration of less than 60 mg/liter. pH affected the rate of nitrification. Optimum pH was 8.4. Temperature affected the rate of nitrification. The rate increased through the range of 5 deg C to 30 deg C. The time required for nitrification is directly proportional to the amount of nitrifiers present in the system. Instantaneous increases or decreases in BOD concentration from 50 mg/liter to 5 or to 110 mg/liter did not affect the rate of nitrification. (Knapp-USGS)

PHYSICAL-CHEMICAL NITROGEN REMOVAL FROM MUNICIPAL WASTEWATER,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
A. F. Cassel, T. A. Pressley, W. W. Schuk, and D. F. Bishop.
Available from NTIS, Springfield, Va. 22151 as PB-214 563; Price $3.00 printed copy; $1.45 microfiche. March 1971. 27 p, 6 fig, 7 tab, 15 ref.

Descriptors: *Ion exchange, *Ammonia, *Waste water treatment, *Chlorination, Tertiary treatment, Nitrates, *Nitrogen, Zeolites.
Identifiers: Clinoptilolite.

Selective ion exchange for ammonia removal, using the natural zeolite, clinoptilolite, was applied to lime clarified and filtered raw wastewater both before and after carbon adsorption. Intermittent operation of the ion exchange unit with minimum operator surveillance produced an average of 75% removal of NH3-N over a 10-month period. With 24-hour surveillance of the operation, and an inlet NH3-N of 12 mg/per liter, the residual NH3-N averaged 0.6 mg/liter for a 95% removal. Breakpoint chlorination for ammonia removal was applied in the pilot plant to filtered secondary effluent and to selective ion exchange effluent. Chlorination of filtered secondary effluent in an agitated reactor removed essentially all the NH3-N with 95% conversion to N2 gas. The CL:NH3-N weight ratio required for successful breakpoint was 8 to 9:1. Base usage, a function of chlorine dosage and the reaction pH, ranged from 0.88 pounds NaOH per pound of CL2 at pH 6.0 to 1.67 pounds per pound at pH 7.9. Nitrate formation, a function of pH, ranged from 3.6% of influent NH3-N at pH 6.0 to 5.9% at pH 8.0. Operation at pH greater than 6.0 with good mixing and chlorine dosage control produced essentially no nitrogen trichloride. (Knapp-USGS)

STUDY OF HYDROPHILIC MEMBRANES FOR OIL-WATER SEPARATION,
Gulf Environmental Systems Co., San Diego, Calif.
C. E. Milstead, and J. F. Loos.

Available from NTIS, Springfield, Va. 22151 as AD-758 321; Price $3.00 printed copy; $1.45 microfiche. Final Report to Department of Transportation, January 1973. 81 p, 23 fig, 7 tab, 10 ref. DOT-CG-24291

Descriptors: Oil spills, *Water pollution treatment, *Membrane processes, *Separation techniques, Membranes, *Oil pollution, Oily water, *Waste water treatment, Water pollution control.

Hydrophilic membranes were tested for oil-water separations and to evaluate their applicability for shipboard use. Twenty membranes were screened with respect to oil rejection capabilities and product water flux. The most promising membrane, a surface-hydrolyzed cellulose acetate, showed essentially complete oil rejection. The effects of input feed temperature, flow rate, salt concentrations, applied pressure, and type and concentration of oil contaminants were determined. Several simple cleaning procedures were investigated in an effort to restore product water flux after fouling of the membrane surface with oil. Preliminary designs for low-pressure systems to produce 100 and 1000 gpm of oil-free product were developed, based on a spiral-wound modular system. A summary of limitations and constraints of a proposed 100-gpm system for shipboard application is presented, along with spatial, weight, and energy requirements and economic factors for such a system. (Knapp-USGS)

WATER-QUALITY ASPECTS OF GROUND-WATER RECHARGE IN ISRAEL,
Ministry of Agriculture, Tel-Aviv (Israel). Water Pollution Control Univ.
J. Goldshmid.
Journal of the American Water Works Association, Vol 66, No 3, p 163-166, March 1974. 1 fig, 3 tab, 7 ref.

Descriptors: *Artifical recharge, *Water quality, *Water treatment, *Injection wells, Water pollution sources, Coliforms, Algae, Biodegradation, Organic matter, Chlorination, Potable water, *Waste water treatment.
Identifiers: *Israel.

Because of the differences in rainfall and water needs in northern and southern Israel, a method of recharging groundwater and transporting it from the north to the south is used. Most of the water is recharged in the Pleistocene sandy aquifer of the coastal plain and in the Karstic Turonian-Cenomanian aquifer at the foothills of Judea and Samaria. Most of the water is recharged into the aquifer through dual-purpose wells (pumping as well as recharging). Water pumped from a recharge well after a pause period has a septic odor. It usually takes from several hours to one day for the pumped water to become odor free. The treated water contains on the average an algal concentration of 400 asu/ml and MPN less than 2/100 ml. During recharge the sand around the well casing filters the organic debris and the residual bacteria. The bacteria adhere strongly to the sand and do not disperse into the aquifer. When the recharge is stopped, the bacteria multiply, using the accumulated organic debris for food. The decomposition of the organic matter starts as an aerobic process. After all the oxygen has been consumed, it turns anaerobic and septic. After about 100 days from the end of the recharge, the decomposition process ends and no more coliform bacteria are found in the pumped water. When pumping starts before the end of the decomposition process, the water is turbid and septic with high coliform counts. To overcome the problem all the water pumped from recharge wells is chlorinated. Chlorination continues until the water pumped from the well meets the bacteriological drinking-water standards. (Knapp-USGS)

RENOVATING MUNICIPAL WASTEWATER BY HIGH-RATE INFILTRATION FOR GROUND-WATER RECHARGE,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
H. Bouwer.
Journal of the American Water Works Association, Vol 66, No 3, p 159-162, March 1974. 3 fig, 11 ref.

Descriptors: *Water reuse, *Tertiary treatment, *Artificial recharge, *Arizona, Water spreading, Infiltration, Alluvial channels, Reclaimed water, *Waste water treatment.
Identifiers: *Phoenix(Ariz), Salt River Basin(Ariz).

A pilot project in the Salt River bed west of Phoenix, Arizona, showed that secondary-sewage effluent can be renovated effectively by groundwater recharge with high-rate infiltration basins. Essentially complete removal of BOD, suspended solids, and fecal coliforms was obtained, and nitrogen and phosphate were reduced. To renovate the present flow of about 3.5 cu m per s of the two Phoenix treatment plants, about 120 ha of infiltration basins would be required. This would increase to about 360 ha if the flow of 10.5 cu m per s, projected for the year 2000, were to be renovated. The infiltration basins could be located along both sides of the Salt River bed, and the renovated water could be pumped from wells in the center of the riverbed. Such a system would produce renovated water of more than sufficient quality to permit unrestricted irrigation and recreation. The total cost of putting the effluent underground and of pumping it up as renovated water in the Salt River bed is estimated at about $3.30 per ha-m. This is much less than the cost of equivalent treatment in a tertiary treatment plant. (Knapp-USGS)
W74-06364

PROCESS FOR RECOVERING FOREST PRODUCT PLANT WASTES,
R. E. S. Thompson.
Typescript, Jan 1, 1974. 13 p, 1 fig, 7 claims.

Descriptors: *Patents, Pollution abatement, Pulp and paper industry, *Wood wastes, *Solid wastes, Waste disposal, *Activated carbon, Saw mills, Sawdust, *Incineration, Filters, Filtration, *Pulp wastes, *Waste treatment, Air pollution, Water pollution control, Steam, Waste water treatment, Recycling, Effluents, Industrial wastes, Treatment facilities.
Identifiers: Furnaces, Carbonization, Pyrolysis, Gas scrubbing, Flue gases, Briquets, Steam generators, Chemical recovery, Forest products industry.

A method is described (Patent No. 3,783,128) for the closed-circuit processing of all waste products from pulp and paper mills or other forest-products enterprises without air or water pollution. Solid wastes, notably bark, wood chips, and sawdust, are carbonized to a char, at least a portion of which is treated in a second furnace to produce activated carbon, the remainder being sold in briquetted form. The activated carbon is used as a filter medium for aqueous factory effluents which can be recycled after solids removal. The carbon and entrained solids are recycled to one of the furnaces. Off-gases from all furnaces are passed to a boiler for steam generation, and the spent gas can be passed through an absorber (gas scrubber) before final release. (Lynch-IPC)

WATER AND WASTE WATER MANAGEMENT IN THE MANUFACTURE OF STRUCTURAL FIBERBOARDS IN POLAND (ZAGADNIENIA GOSPODARKI WODNOSCIEKOWEJ PRZEMYSLU PLYT PILSNIOWYCH NA TLE GOSPODARKI WODNEJ W POLSCE),
A. Dudzinski, and W. Onisko.
Przeglad Papierniczy, Vol 29, No 7, p 260-263, July 1973. 2 fig, 2 tab, 13 ref.

Descriptors: *Waste water treatment, *Pulp wastes, Europe, *Industrial water, *Pollution abatement, *Water reuse, Water consumption, Irrigation, Soil disposal fields, Rivers, Waste treatment, Industrial wastes, Recirculated water, Water pollution control, Effluents, Waste disposal, Coagulation, Sedimentation, Pulp and paper industry.
Identifiers: *Poland, Building boards, Fisherboards, Hardboards, Insulation boards.

Industrial water consumption in Poland is still below the estimated permissible maximum of 30 cu km/year, but increasing steadily and evidencing some local shortages. The wood-processing industry accounts for only 6.1% of total industrial consumption, and the fiberboard (building board) industry a small fraction thereof. Hence no Polish fiberboard factory has yet suffered from lack of water supply, despite their relatively high specific consumption per ton of board produced. Most fiberboard factories purify their effluents, albeit inadequately, except at Czarna Woda, where effluents are diluted with river water and disposed of by soil irrigation. Pollution of the Wda River has been remedied. Effluent treatment methods are selected according to local conditions, but a more uniform management approach is in evidence. Of the two discernible trends, one involves reduction of water consumption (by improved technology and recirculation) from 41 to 10-20 cu m per ton, followed by effluent purification. The other shows a greater reduction (to 1-5 cu m/ton), followed by combustion of wastes. Two recent treatment methods are gaining in favor. The Finnish Savo process is based on coagulation, sedimentation, and recycling of purified effluent. The other is a Swedish process, in which effluents are subdivided into highly polluted and less polluted portions by means of a DKP or Davenport press, and the streams are treated separately. (Stapinski-IPC)

CALCULATION OF FRESHWATER CONSUMPTION (NALADIT' UCHET RASKHODA SVEZHEI VODY),
G. E. Gal'per, and Ya. V. Nikitin.
Bumazhnaya Promyshlennost', No 8, p 17-18, Aug 1973.

Descriptors: *Water consumption, *Industrial water, Freshwater, *Pulp and paper industry, *Pulp wastes, Effluents, Discharge(Water), Europe, Foreign countries, Regulation, Legislation, Water law, Water management(Applied), *Water reuse, *Recycling.
Identifiers: *USSR, Silvichemical industry, Forest products industries, Reporting accountability.

The Soviet pulp, paper, and silvichemical industries consume nearly 10 million cu m of water daily, of which 70% is used by the 21 leading factories accounting for 50% of total industry production. The coefficient of recycled water utilization averages 0.54 and is 0.74 for the 21 leading plants. Effluent discharge volumes are 92-95% of the freshwater consumed. Most mills consume or exceed the upper limits allowed by USSR standards which permit 20-27 cu m/ton for groundwood and up to 1200-3300 cu m/ton of capacitor paper (which must be washed free of electrolytes). Mill records, if kept at all, show only overall water consumptions and effluent discharges, but not for individual manufacturing steps or processes. A recently issued government regulation specifies not only the permissible water use per ton of various products, but also the volume allowed in various processing stages, such as pulpwood preparation, cooking liquor preparation, pulp screening and cleaning. Henceforth all pulp and paper mills and wood-processing factories will be required to keep detailed records and submit reports on water consumption figures, as well as to install water meters on all supply lines. These measures are hoped to reduce freshwater and effluent volumes substantially throughout the industry. (Stapinski-IPC)
W74-06381

AN EFFECTIVE METHOD FOR THE ISOLATION OF FISH-TOXIC ORGANIC SOLUTES FROM PULP MILL EFFLUENTS,
Western Forest Products Lab., Vancouver (British Columbia).
I. H. Rogers, J. A. Servizi, and R. W. Gordon.
Bimonthly Research Notes, Vol 28, No 4, p 24-25, July-August, 1972. 3 ref.

Descriptors: *Separation techniques, Pollutant identification, Fish, *Toxicity, *Isolation, *Bioassay, *Pulp wastes, *Waste water treatment, *Color, *Ion exchange, Waste treatment, Pulp and paper industry, Salmon, Sockeye salmon, Solvent extractions, Analytical techniques, Waste water(Pollution), Pollutants, Organic compounds.
Identifiers: Methanol(Methyl alcohol), Kraft mills, Chemical recovery.

A procedure for quantitatively recovering toxic organic components from kraft pulp mill waste waters involves pre-extraction of Amberlite XAD-2 resin with methanol to remove low-molecular-weight contaminants, then passing a 5-gal sample of the aqueous waste through the resin column, collecting the effluent, and conducting a bioassay with sockeye salmon fry. The column is washed with 5 liters of 0.05N NaOH solution plus 5 liters of water. The alkaline extract and wash water are combined, neutralized, and bioassayed after dilution to the same concentration as the original waste water sample. The column is then stripped with 3 liters of methanol, the methanol is evaporated under vacuum, and the residue is dissolved in 100 ml of water. The toxic compounds are recovered almost quantitatively in the methanol fraction. For color removal, the methanol fractions are extracted with ether in a liquid-liquid extractor. The pale yellow oils recovered can be separated by chemical methods to identify the compounds responsible for fish toxicity. (Witt-IPC)
W74-06382

WATER USAGE IN THE BRITISH PAPER AND BOARD INDUSTRY,
Research Association for the Paper and Board, Printing and Packaging Industries, London (England). Paper and Board Div.
A. B. Truman, and R. D. Isabell.
Paper (London), Vol 179, No 4, p 177-178, Feb 21, 1973.

Descriptors: *Industrial water, *Water conservation, *Pulp and paper industry, Water treatment, *Costs, *Water consumption, Pollution abatement, Water pollution control, Europe, Freshwater, Effluents, Discharge(Water), *Waste water treatment.
Identifiers: *United Kingdom.

A questionnaire survey of British paper and board mills indicated average freshwater consumptions of 145 cu m or 31,000 gal per ton of pulp. Different mills reported values ranging from 1 to 700 cu m (200-150,000 gal) per ton, but 90% of the mills surveyed indicated less than 120 cu m (25,000 gal) per ton. Freshwater supplies in the U.K. are becoming scarcer, while effluent discharge requirements are getting stricter. Costs of effluent treatment and sludge disposal are high. Hence it is essential that all mills minimize their water consumption to reduce both production costs and environmental pollution. Methods of achieving reductions in freshwater demand and water treatment costs are discussed. (Witt-IPC)
W74-06383

CAN SCREENED WHITE WATER BE RECYCLED TO SHOWER FELTS,
Trent Valley Paperboard Mills (Ontario).
B. B. Renshaw.
Pulp and Paper Magazine of Canada, Vol 74, No 11, p 40, 42, 44, Nov 1973. 3 fig, 1 tab.

Descriptors: *Water reuse, *Recirculated water, *Screens, *Filtration, Filters, *Pulp wastes, *Industrial water, Water conservation, Water circulation, Pulp and paper industry, Suspended solids, Freshwater, River water, Waste water treatment, Particle shape, Particle size.
Identifiers: Shower water, Board machines, Cylinder board machines, Paperboard mills, *White water(Paper machine), Felts(Papermaking), Showers(Paper machine).

At Trent Valley Paperboard Mills, white water from two six-vat cylinder board machines making over 100 tons/day of uncoated boxboards will be passed through Sweco concentrators (rotary vertical screen baskets), and the filtered water will be reused in felt-cleaning showers. This partial closing of the machine's water circuits is expected to save significant volumes of freshwater while reducing the clarifier load by 400 gal/min or more. Initial trial runs with the Sweco screen indicated that the reusability of the white water was governed not so much by the quantity of suspended particles (up to a certain limit) as by their size and shape, the smaller uniform particles causing no shower clogging problems. No significant felt plugging or picking was observed with screened white water (that had passed through a saveall), compared to river water. (Brown-IPC)
W74-06384

THE ANTI-POLLUTION SEQUENCE - A NEW ROUTE TO REDUCED POLLUTANTS IN BLEACH PLANT EFFLUENT,
Hooker Chemical Corp., Niagara Falls, N.Y.
R. J. Gall, and F. H. Thompson.
Tappi, Vol 56, No 11, p 72-76, Nov 1973. 4 fig, 25 ref, 7 tab.

Descriptors: *Waste water treatment, Pollution abatement, Water pollution control, *Pulp wastes, *Bleaching wastes, Pollutants, Effluents, Pulp and paper industry, *Chlorination, Chlorine, Economics, Costs, *Color, Chlorides, Chemical oxygen demand, Biochemical oxygen demand, Water pollution sources.
Identifiers: Hypochlorites, Bleach plants, Pulp bleaching, Chemical consumption.

Substantial reduction in effluent color and moderate reductions in chlorides, COD, and BOD have been achieved by the restructuring of conventional pulp bleaching sequences. Sequential chlorination has replaced conventional chlorination, and hypochlorination was substituted for the first alkaline extraction stage. This antipollution sequence (APS) utilizes existing bleach plant chemicals and available or slightly modified bleach plant equipment. The process is adaptable to both softwood and hardwood pulps. The pollutant reductions achieved required equivalent or slightly higher than usual chemical costs. (Brown-IPC)
W74-06385

BELLMER CONVERGING DOUBLE-BELT PRESS, AN INTERESTING MACHINE FOR SLUDGE DEWATERING (DIE BELLMER-WINKELPRESSE, EIN INTERESSANTES GERAET FUER DIE SCHLAMMENTWAESSERUNG).
Das Papier, Vol 27, No 8, p 357-358, Aug 1973. 1 fig, 3 tab.

Descriptors: *Dewatering, *Sludge treatment, *Treatment facilities, *Equipment, Pulp wastes, Sewage treatment, Municipal wastes, Industrial wastes, Waste treatment, *Waste water treatment.
Identifiers: *Bellmer dewatering press, Germany.

The dewatering press described and illustrated is marketed by Gebrueder Bellmer KG, Niefern, West Germany, and comprises essentially two plastic wire screens circulating around rotating cylinders. Performance data for municipal (sewage) and industrial (paper mill) sludges are given, along with some capital and operating cost data. (Speckhard-IPC)
W74-06386

PRACTICAL APPROACH TO WATER CONSERVATION IN A PAPER MILL,
Papeteries Boucher, Calais (France).
J. J. Wilkinson.
Pulp and Paper International, Vol 15, No 5, p 59-62, May 1973. 1 fig, 3 tab.

Descriptors: *Water conservation, *Industrial water, *Pulp and paper industry, *Water reuse, *Recirculated water, *Water consumption, Water circulation, Lubrication, Cleaning, Operation and maintenance, Design, Equipment.
Identifiers: Wash water, Shower water, Showers(Paper machine), Felt conditioners, Paper machines.

Although the pulp and paper industry has made considerable progress in reducing its water consumption, much more can be achieved by using modernized methods and equipment. The use of water for washing, general cleaning, felt conditioning, wire showers, and lubrication of shaft packing boxes is discussed. Careful attention to details of mill design, including proper selection of auxiliary equipment, provisions for greater reuse of water, and machine operation, can contribute to substantial further reductions in specific water consumption to manufacture a ton of paper. (Hansen-IPC)

SOME PROBLEMS ASSOCIATED WITH WATER REUSE,
Betz Labs., Inc., Trevose, Pa.
B. S. Shema.
American Paper Industry, Vol 55, No 9, p 31-33, Sept 1973. 6 fig.

Descriptors: *Water reuse, *Recirculated water, *Pulp and paper industry, *Water conservation, Recycling, Slime, Corrosion, Algae, Bacteria, Aquatic organisms, Resins, Water circulation, Water chemistry, Effluents, Discharge(Water), Industrial water, Freshwater, Microorganisms, Operation and maintenance.
Identifiers: Pitch, Wood resins, Paper machines.

Common sense and environmental concerns dictate that water should be reused as often as possible. Benefits derivable from a closed water circulation system in paper mills include conservation of freshwater, chemicals, and heat, and reduced volumes of discharged effluent. Problems associated with water reuse may include machine operating difficulties, such as corrosion, scale and microbiological deposits, pitch troubles (due to accumulation of wood resins), and algal or bacterial slimes. All of these problem areas are discussed, and possible countermeasures are indicated. (Wise-IPC)

DEWATERING OF BIOLOGICAL-CHEMICAL PAPER MILL WASTE WATER SLUDGE WITH THE 'SYSTEM HILLER' KHD CENTRIFUGE (ENTWAESSERUNG VON BIOLOGISCH-CHEMISCHEM PAPIERFABRIKSABWASSER-SCHLAMM MIT DER KHD-ZENTRIFUGE 'SYSTEM HILLER'),
Cellulose Attisholz A.G., Luterbach (Switzerland).
A. Scherler.
Wochenblatt fuer Papierfabrikation, Vol 100, No 20, p 739-743, October 31, 1972. 3 fig, 2 tab.

Descriptors: Treatment facilities, *Sludge treatment, *Waste water treatment, *Separation techniques, *Dewatering, *Centrifugation, *Pulp wastes, Europe, Equipment, Energy, Maintenance, Flocculation, Centrifugal pumps.
Identifiers: *Switzerland, KHD centrifuge, Centrifuges, Biberist Papierfabrik(Switzerland).

The design, operating principle, and capital and operating costs of the KHD (Klockner-Humboldt-Deutz) centrifuge are outlined. Particular ad-

vantages claimed for this apparatus in dewatering sludge from pulp and paper mill effluent treatment include compactness, low noise level, high wear resistance, economic energy consumption, low maintenance needs, metered dosage of flocculant and hence chemical savings, and operating flexibility. After preliminary laboratory evaluations, with encouraging results, a commercial unit was constructed and installed at the Biberist Papierfabrik in Switzerland. (Speckhard-IPC)
W74-06392

RECENT ADJUSTMENTS IN WATER USE AND TREATMENT BY U.S. MANUFACTURERS,
Urban Inst., Washington, D.C.
R. J. Struyk.
Water Research, Vol 7, No 6, p 911-925, June 1973. 2 tab, 4 ref.

Descriptors: Economic impact, *Water reuse, Water treatment, *Industrial water, *Water utilization, *Prices, *United States, Pulp and paper industry, Surveys, Statistical methods, *Waste water treatment.

Statistical data of two kinds are provided concerning trends in water reuse and water treatment by U.S. manufacturers: (A) A display and discussion of water use trends during 1964-1968 in the largest water-using industries indicates sizeable adjustments in reuse and treatment as a whole and for individual industry segments. (B) The extent to which observed adjustments are viewable as responses to changes in the price of industrial water supplies is evaluated by price/quality and price/treatment relations, based on regional observations in four major water-using industries, including the pulp and paper sector. Results indicate this analytical approach to be promising, but the data do not suffice to permit reliable quantification of the effects of individual price variables. (Witt-IPC)

PULP AND PAPER MILL SLUDGE DISPOSAL BY COMBUSTION,
Crown Zellerbach Corp., Camas, Wash.
A. S. Rosenfeld, T. R. Aspitarte, and H. R. Amberg.
Tappi, Vol 56, No 10, p 97-100, Oct 1973. 2 fig, 8 tab.

Descriptors: *Sludge disposal, *Incineration, *Pulp wastes, *Costs, *Operating costs, Ultimate disposal, Industrial wastes, Waste disposal, Pulp and paper industry, Equipment, Air pollution, Economic efficiency, Waste treatment.
Identifiers: Furnaces, White waters.

The combustion of fibrous sludge from paper mill white waters is a low-pollution disposal method, since proper operation of incineration equipment can meet present air quality standards. The cost of combustion in an air-entrained dryer-incinerator is ca. $13.00 per ton of (dry) sludge; incineration in a hog-fuel boiler would cost ca. $11.50 per oven-dry ton. (Brown-IPC)

COLOR REMOVAL PROCESS.
Pulp and Paper International, Vol 15, No 5, p 69, May 1973. 1 fig.

Descriptors: *Waste water treatment, *Color, *Pulp wastes, *Foreign research, Europe, *Canada, *Polymers, Flocculation, Coagulation, Chemical oxygen demand, Biochemical oxygen demand, Organic compounds, Economic feasibility.
Identifiers: Amines, Polyamines, Amino resins, Kraft mills.

A method developed and patented in France for decoloring pulp mill effluents involves contacting the main color-carrying streams with high-molecular-weight amines in a water-immiscible solvent. The process removes 90-98% of the color, 45-85% of the COD, and 30-70% of the BOD from the effluents. The amines can be regenerated and recirculated. Small-scale tests in a kraft mill gave results as good as did laboratory trials at the Pulp and Paper Research Institute of Canada. They will be followed by economic feasibility studies and larger-scale trials. (Hansen-IPC)

WORLD'S LARGEST DEEP AERATED STABILIZATION BASIN IN NEW ZEALAND,
New Zealand Forest Products Ltd., Kinleith.
J. L. Vickerman, and H. W. Gehm.
Paper Trade Journal, Vol 157, No 28, p 24-26, July 9, 1973. 5 fig, 3 ref.

Descriptors: *Aeration, *Pulp wastes, *Waste water treatment, Engineering structures, Dams, *Oxidation lagoons, *Aerated lagoons, Valleys, Streams, River basins, Effluents, Industrial wastes, Waste treatment, Lakes, Pollution abatement, Pulp and paper industry, Australia, Oxygen, Oxygenation.
Identifiers: *New Zealand, Kraft mills, Aerators, Lake Maraetai(New Zealand).

In connection with the expansion of a bleached kraft pulp and paper mill, New Zealand Forest Products Ltd. at Kinleith, N.Z., created a 55 ft deep waste water stabilization basin by constructing a 60 ft high dam across the stream valley which carries the mill's effluents to Lake Maraetai. The aeration basin should provide a detection period of 4.5 days and is equipped with ten down-draft aerators, each of 50-hp capacity, for a total daily aeration performance of 30,000 lb of oxygen. (Hansen-IPC)

Identifiers: Fatty acids, Aliphatic acids, Carboxylic acids, Cyanides, Azo dyes, Triazine dyes, Reactive dyes, Viscose rayon.

A review is presented of electrochemical methods for the removal of various pollutants from industrial waste waters, including cyanides, phenols, sulfur compounds, and phosphorous compounds. Among industrial wastes discussed in particular are effluents from pulp and paper mills, viscose rayon factories, azo and triazine dye manufacture, and the production of synthetic fatty acids. Economic considerations are also mentioned. (Chern-IPC)

Identifiers: *Formaldehyde, *Methanol(Methyl alcohol), USSR.

Batch-process oxidations in a laboratory apparatus were conducted on aqueous solutions of phenol, methanol, and formaldehyde, separately and in binary and ternary mixtures, at 200 C and 40 atm pressure. After 1.5 hr, the COD levels were reduced by 94.7% for phenol, 76.8% for methanol, and 92.7% for formaldehyde. The COD of the original ternary mixture, which was 60,000 mg of oxygen/liter, was reduced by 80% in 1 hr. (Chern-IPC)

BIOLOGICAL WASTEWATER TREATMENT SYSTEM DESIGN. PART I. OPTIMAL SYNTHESIS,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
P. M. Mishra, L-T. Fan, and L. E. Erickson.
Canadian Journal of Chemical Engineering, Vol 51, No 6, p 694-701, Dec 1973. 2 fig, 1 tab, 45 ref.

Descriptors: *Systems analysis, *Optimization, *Biological treatment, *Waste water treatment, *Trickling filters, *Activated sludge, *Aeration, Treatment facilities, Design, Design criteria, Design data, Waste treatment, Mathematical models, Simulation analysis, Costs, Cost-benefit analysis, Mathematical studies.
Identifiers: Clarifiers, Secondary treatment, Process variables.

Common practice for design of biological waste water treatment systems involves the evaluation of certain fixed structure systems at several alternative conditions. The structural parameter system synthesis technique was used to optimize both the structure and the design of a system comprising a trickling filter, an activated sludge aeration vessel, and a secondary clarifier. Results of optimal synthesis indicated that the activated sludge system was the most cost-effective system for the specific set of process parameters examined. The same conclusion was reached by optimizing several systems with different structures. (See also W74-06408) (Brown-IPC)
W74-06407

BIOLOGICAL WASTEWATER TREATMENT SYSTEM DESIGN. PART II. EFFECTS OF PARAMETER VARIATIONS ON OPTIMAL PROCESS SYSTEM STRUCTURE AND DESIGN,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
P. N. Mishra, L-T. Fan, and L. E. Erickson.
Canadian Journal of Chemical Engineering, Vol 51, No 6, p 702-708, Dec 1973. 10 fig, 1 tab, 8 ref.

Descriptors: *Biological treatment, Systems analysis, *Optimization, Treatment facilities, *Activated sludge, *Trickling filters, *Aeration, *Waste water treatment, Design, *Design criteria, Design data, Waste treatment, Mathematical models, Simulation analysis, Mathematical studies, Costs, Cost-benefit analysis.
Identifiers: Clarifiers, Secondary treatment, Process variables.

The effects of varying the feed concentration and rate constants on the optimal structure and design of a biological effluent treatment systems comprising a trickling filter, an activated sludge aeration vessel, and a secondary clarifier were investigated. The system was synthesized computationally for different sets of parameter values, and the corresponding changes in system structure and design were evaluated. The results indicated that

the optimal structure and design are sensitive to variations in both rate constants and feed concentration. Some innovative process flowcharts having surprisingly low total costs were deduced. In certain cases, capital costs of combined systems are lower than those using a single (activated sludge) unit to perform the same task. Major advantages of installing a trickling filter ahead of an activated sludge unit involve a smoothing out of the organic loading and a reduction of plant performance interruptions. Owing to an inadequate model for the secondary clarifier, the effect of its operating parameter variations has not yet been investigated. (See also W74-06407) (Brown-IPC)
W74-06408

MINE WATER PURIFICATION BY REVERSE OSMOSIS,
Lakehead Univ., Thunder Bay (Ontario). School of Engineering.
R. G. Rosehart.
Canadian Journal of Chemical Engineering, Vol 51, No 6, p 788-789, Dec 1973. 2 fig, 2 tab, 2 ref.

Descriptors: *Reverse osmosis, Desalination, *Mine water, *Mine drainage, *Waste water treatment, *Treatment facilities, Membrane processes, Membranes, Arsenic compounds, Calcium, Zinc, Mine wastes, Potable water, Hydrogen ion concentration, Pilot plants.
Identifiers: *Cyanides, Cellulose acetate, Hollow-fiber membranes.

A small reverse osmosis (R.O.) pilot plant was constructed and tested first on copper sulfate solutions. Its use for removing dissolved arsenic from acid mine drainage water gave encouraging results with conventional cellulose acetate membranes. On the other hand, the recovery of alkaline barren solutions (containing Ca, Zn, and cyanide ions) from gold-processing wastes was unsatisfactory, even with hollow-fiber membranes. The R.O. process seemed ideal, however, for demineralization of drinking water. (Brown-IPC)
W74-06409

SCREENING AND SELECTION OF SOLVENTS FOR EXTRACTION OF PHENOL FROM WATER,
Toronto Univ. (Ontario). Dept. of Chemical Engineering.
P. R. Kiezyk, and D. Mackay.
Canadian Journal of Chemical Engineering, Vol 51, No 6, p 741-745, Dec 1973. 1 fig, 1 tab, 23 ref.

Descriptors: *Phenols, *Waste water treatment, *Solvents, *Solvent extractions, *Separation techniques, Thermodynamic behavior, Aqueous solutions, Solubility, Ethers, Alcohols, Organic compounds, Industrial wastes, Effluents, Toxicity, Biodegradation, Molecular structure.
Identifiers: Esters, Ketones, Functional groups.

Experimental data on the distribution coefficients of phenol between two solvents show considerable variations at low phenol concentrations. Hence it is essential to obtain such data over the entire concentration range so as to avoid extrapolations from higher to lower concentrations. Experimental and literature data for phenol distributions between water and 26 solvents were correlated successfully, based on thermodynamic considerations. The solution theory used takes into account polar interactions and provides an interaction energy term that depends on the functional groups present in the solvent molecules. Although the accuracy of this approach is insufficient for system design purposes, it suffices for the screening of solvents suitable for phenol extraction from waste waters. The preferred solvents include ethers, esters, ketones, and alcohols, not only because of their favorably high distribution coefficients, but also because of their relatively low toxicity and higher biodegradability. The use of such solvents mixed with an inert solvent is an attractive practical possibility for phenol removal from aqueous industrial effluents. (Brown-IPC)
W74-06410

ACTIVATED CARBON ADSORPTION AND POLISHING OF STRONG WASTEWATER,
New York State Dept. of Environmental Conservation, Albany.
T. J. Tofflemire, L. J. Hetling, and W. W. Shuster.
Journal Water Pollution Control Federation, Vol. 45, No. 10, p 2166-2179, Oct 1973. 3 fig, 7 tab, 37 ref.

Descriptors: *Adsorption, *Activated carbon, *Waste water treatment, *Sewage treatment, *Industrial wastes, *Domestic wastes, *Pulp wastes, Waste treatment, Pilot plants, Laboratory equipment, Hydrogen sulfide, Anaerobic conditions, Filtration, Chemical oxygen demand, Color, Dyes, Flow rates, Operation and maintenance.

A small laboratory adsorption unit, a pilot plant, and an upflow column system were compared for purification efficiency of a mixed domestic-industrial waste water. All systems effectively removed color bodies originating from paper dyes. The pilot plant gave the poorest COD removals, probably because of lack of backwashing and prior filtration. Problems in all carbon adsorption systems resulted from high residual COD and from anaerobic conditions with attendant generation of hydrogen sulfide. Other problems with the upflow system included channelling of the flow through the column's bottom portion, and difficulty in backwashing. Prior filtration through sand and the use of high-speed water jets lessened these difficulties. It may be necessary to polish such mixed effluents which often are anaerobic. (Witt-IPC)
W74-06411

SUBMERGED TURBINE AERATORS FOR WASTE WATER TREATMENT,
Philadelphia Mixers Corp., Pa.
R. L. Winter.
Paper Trade Journal, Vol 157, No 38, p 45-47, Sept 17, 1973. 2 fig.

Descriptors: *Treatment facilities, *Aeration, *Waste water treatment, *Turbines, Equipment, Aerated lagoons, Oxidation lagoons, Diffusion, Impellers, Pumps, Mixing, Industrial wastes, Pulp wastes.
Identifiers: Aerators, Compressed air, *Turbine aerators.

Three major types of water aeration equipment and methods are described, including diffuse air, surface agitation, and submerged turbine aerators. Factors involved in selecting the most appropriate system for increasing the dissolved oxygen content of waste waters are discussed. Experience has shown that submerged turbine aeration units are highly effective in dispersing oxygen throughout an aeration basin. Actually this method combines the diffused-air and the surface-agitation principles. Compressed air is introduced under pressure to the bottom of the basin by means of a diffuser. An impeller positioned just above the diffuser assures thorough mixing of air and water. (Witt-IPC)
W74-06412

CONSOLIDATED INSTALLING ONE WASTE TREATMENT PLANT FOR THREE PLANTS.
Paper Trade Journal, Vol 157, No 32, p 29, Aug. 6, 1973.

Descriptors: *Treatment facilities, *Wisconsin, *Pulp wastes, *Water pollution treatment, *Waste water treatment, Pulp and paper industry, Effluents, Aerated lagoons, Lagoons, Aeration, Pumps, Pipelines.
Identifiers: Clarifiers, Wisconsin Rapids(Wis.)

Consolidated Papers, Inc., recently started construction of a waste water treatment installation to serve its three company divisions located near Wisconsin Rapids, Wisconsin. Production facilities include a groundwood, a waste paper-processing, a kraft pulp, a paperboard, and two white paper mills. The treatment plant will include lift pumping stations at each of the three company divisions, a system of pipelines to convey the effluents to the treatment plant, two primary clarifiers, an aeration lagoon, and two final clarifiers. This installation will handle a total effluent flow of ca. 22.8 million gal per day. (Witt-IPC)

WATERVLIET PAPER COMPLETES WASTE WATER DISPOSAL SYSTEM.
Southern Pulp and Paper Manufacturer, Vol 36, No 8, p 26-28, Aug. 1973. 1 illus.

Descriptors: *Pulp wastes, *Waste water disposal, Ultimate disposal, *Michigan, Irrigation, *Soil disposal fields, Spraying, Pipelines, Grasslands, Water supply, Pulp and paper industry, Rivers, Waste disposal, Suspended solids, Screens, Filtration, Waste water(Pollution), Pollution abatement, Effluents.
Identifiers: Paw Paw River(Mich), Watervliet(Mich), Reeds, Canary reed, *Spray irrigation.

At Watervliet, Michigan, the Watervliet Paper Co., (a division of Hammermill Paper Co.) disposes of ca. 1 million gal/day of mill effluent by spray irrigation. A pipeline 1.4 mile long delivers the waste water to the irrigation field where it is sprayed onto 11-acre zones in 10-hr rotation periods. Preliminary screening of the waste water removes all but 0.01% of the suspended solids. The irrigation field is planted with water-thriving Canary reed grass, which keeps the surface soil loose and promotes drainage to the underlying sand strata. The paper mill draws all its water supply from wells and places no load on the nearby Paw Paw River for either supply or disposal. (Hansen-IPC)

CONDITIONING AND DISPOSAL OF SOLIDS FROM POTATO WASTEWATER TREATMENT,
CH2M/Hill, Corvallis, Oreg.
G. A. Richter, K. L. Sirrine, and C. I. Tollefson.
J Food Sci. Vol 38, No 2, p 218-224, 1973. Illus.
Identifiers: *Idaho, *Potato processing wastes, *Sludge disposal, Snake River(Ida), *Waste water treatment, Tertiary treatment, Aerobic digestion, Dewatering, Waste disposal, Solid wastes.

Aerobic biological secondary treatment of primary clarified potato processing wastewater in Shelley, Idaho yields biological solids in excess of that needed to operate the treatment system. In the past, these diluted biological solids were discharged into the Snake River or dewatered along with silt water(at a high chemical cost) and used as landfill. A study was conducted during the 1970-71 potato processing season to investigate alternative methods of waste biological solids conditioning and disposal. A pilot scale spray field and pilot scale equipment, including a basket centrifuge and aerobic digester, were used during the study. Operation of a waste biological solids spray irrigation system at reasonable application rates should not produce objectionable odors; successful operation will require prescreening and special sprinkler heads for freezing weather application. Basket centrifuges are effective for concentrating waste biological solids from aerobic biological treatment systems with sludge volume indexes up to and over 250. Fifteen days aerobic digestion substantially improves the dewaterability of the waste biological solids at 16C.--Copyright 1973, Biological Abstracts,Inc.

PROTECTING AMERICA'S ESTUARIES: FLORIDA.
Hearings--Subcomm. of Comm. on Government Operations, U.S. House of Representatives, 93d Cong, 1st Sess., May 25, 1973. Parts 1-A and 1-B. 2520 p.

Descriptors: *Federal government, *Decision-making, *Florida, *Estuarine environment, Environmental sanitation, Administration, Adoption of practices, State governments, Legislation, Regulation, Monitoring, Data collection, Dredging, Flood protection, Remote sensing, Coastlines, Harbors, Lakes, Rivers, Water pollution control, Water quality, Water conservation.
Identifiers: *Congressional hearings, *Coastal waters.

Statements were taken from Congressmen, federal officials, state pollution control officials, the Army Corps of Engineers, members of the National Oceanic and Atmospheric Administration, the Game and Fresh Water Fish Commission, and the Environmental Protection Agency. There is an environmental monitoring program in the Florida jetport area. There are programs for the monitoring of biota, noise, fish and wildlife, and hydraulics. Some of this monitoring is done through the use of aerial photographs. Florida contains over 4,200 square miles of water and its bays and indentations make a coastline of almost 8,500 miles. Florida has over 30,000 ponds and lakes and 1,500 miles of streams and rivers, and also possesses a large wildlife population. The hearings sought to determine whether the various federal agencies are carrying out their duties to protect the environmental quality of Florida. Some of the matters to be covered are: the extent to which the wetlands are being destroyed by dredging and filling; the progress in providing adequate treatment for municipal and industrial wastes; the effect of ocean outfalls on ocean resources and human health; efforts to prevent eutrophication of Florida waters; and the adequacy of federal enforcement of pollution control laws. Identifiers: Energy crisis.

The energy shortage is complicated by the problem of pollution. Electric power plants seem inevitably to discharge waste heat into the waterways. The National Environmental Policy Act (NEPA) requiring the study of the impact of power plants on the environment has added to industry miscalculations of energy needs. Strip-mining for coal, another potential energy source, has caused landslides, floods, and despoilation of the environment. Nuclear reactors present the most immediate solution, but give off large amounts of waste heat. Fusion reactors, not likely to be developed before the turn of the century, will end man's energy problems. Fusion will take energy from water. Fusion would reduce problems of pollution and radioactive wastes far below the levels of even the breeder reactor. Many different ideas have been developed to obtain energy until fusion reactors are perfected. In Britain one power plant uses the tides to produce energy and creates 240,000 kilowatts. Geothermal power is another potential source of energy and it is estimated California could use this to supply all of its energy needs. (Sperling-Florida)

The development of Pennsylvania law on the problem of acid mine wastes is surveyed. Legislative history indicated a preferential non-treatment of the coal mine drainage problem, along with a lack of technological expertise for removing the polluting properties of such drainage. The 1965 Amendments to the Clean Streams Law prohibited the subsequent discharge of mine drainage, and

required a mine operator to file an application for a permit approving its drainage plan before beginning mining operations. The 1970 Amendments to the Clean Stream Law prohibited mine discharges occurring after mining operations have ceased. A discussion is included of three recent cases under the amended Clean Streams Law. The first two cases held that a mine operator is not required to treat mine drainage which, in essence, is not from its own mining operation, but from adjacent, inactive mines. These cases are on appeal. The third case is pending, and will decide a mine operator's responsibility for acid water discharges after mining operations are abandoned. (Perrey-Florida)

ENVIRONMENTAL INFORMATION SYSTEMS DIRECTORY--AN INVENTORY OF ADMINISTRATIVE AND ENVIRONMENTAL MISSION SUPPORT SYSTEMS WITH INDEXES.
Environmental Protection Agency, Washington, D.C. Office of Planning and Management.
June 1973. 111p.

Descriptors: *Data storage and retrieval, *Information exchange, Systems analysis, Data transmission, Documentation, Abstracts, Information retrieval.
Identifiers: Data systems.

Automated and manual systems supporting the administrative and environmental-mission operations in the Environmental Protection Agency are described. For purposes of the Directory, systems have been defined as sets of manual or automated procedures used to collect, maintain, manipulate and use periodically information or data for a specific objective. Both existing systems and systems under development are included. The Directory consists of an Announcement Section, Subject Index, Organization Index, and System Manager Index. An announcement of each system consists of an identifying citation followed by an abstract or short description of the system. The citation identifies the system by title, location where operated, operational or developmental, year of implementation manual or automated, and the names and titles of System Manager and Data Processing Representative. The abstract describes the systems objectives, major information products and uses, and significant processing steps performed in the system cycle. For automated systems information includes. The number of applications programs, minimum computer memory requirements, and hardware on which the system is operated. (Knapp-USGS)

A. C. Davis.
Available from the National Technical Information Service as PB-230 436, $3.75 in paper copy, $1.45 in microfiche. Water Resources Research Institute at the University of North Carolina, Raleigh, Report UNC-WRRI 74-88, December 1973, 47 p, 26 tab, 4 ref, 3 append. OWRR A-049-NC (3) 14-31-0001-3233.

Descriptors: *Decision making, Planning, Methodology, *North Carolina, Political aspects, *Water pollution control, *Water policy, *Attitudes, State governments, *Social participation, Social aspects.
Identifiers: Public participation, Public hearings.

A study is described of public awareness and concern about stream pollution, and more particularly, about a series of public hearings on stream classification held by the North Carolina Board of Water and Air Resources. Telephone surveys of a random sample of households in the areas affected found (1) a generalized awareness of stream pollution, (2) a concern about its importance, (3) a tendency to see stream pollution as a major topic of state concern, (4) a limited knowledge about state agencies, and (5) little knowledge of the public hearings despite the efforts of the agency. Few respondents attended the public hearings. Analysis of attendance at the hearings tended to show a relatively low level of public participation. Representatives of organized activities whose activities were immediately affected were present. Where suggested changes were perceived as threats to immediate interests, affected individuals also voiced opposition. Some indications of the lack of knowledge on the part of the general citizenry about the means of efficient participation were also noted. (McJunkin-North Carolina)

Descriptors: *Management, Pollutants, Effluent streams, Water allocation, Model studies, Water utilization, *Reviews, *Bibliographies, *Pollution taxes(Charges), Computer models, *Tax rates, Prices, Cost allocation, Cost analysis.
Identifiers: Pollution levels, *Programming models.

The applicability of programming models to problems in water resource management was evaluated. A comprehensive literature survey was made, and an annotated bibliography was prepared. A variety of Simple two-and three-user models were examined. The most interesting model formulation appeared to be one minimizing the costs of supplying the needs of these users subject to constraints on supply and on the levels of various pollutants. The behavior of the solutions to the models was examined utilizing hypothetical cost data. In particular, the shadow prices (or opportunity costs) to the various users were examined in relationship to costs. This exploration led to certain conclusions on the limitations of a tax system on water usage or effluent streams as a device for controlling pollution levels. These conclusions indicate that, under conditions believed to be rather common in water management, taxation cannot assure optimal resource allocation. The investigations indicated that programming models can be of value in examining some of the broader issues in water resource management.

AN APPROACH TO EVALUATION IN MULTIPLE OBJECTIVE RIVER BASIN PLANNING, AN ANALYSIS OF SELECTED WATER QUANTITY ALTERNATIVES IN THE OKANAGAN VALLEY, BRITISH COLUMBIA, CANADA,
Department of the Environment, Vancouver (British Columbia). Water Management Service.
J. O'Riordan.
In: Proceedings (Vol III), The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 48 p, 5 fig, 4 tab, 7 ref.

Descriptors: Water resources, Management, *River basin development, *Comprehensive planning, *Alternative planning, *Evaluation, Water quantity, Methodology, Water users, Simulation analysis, Decision making, Optimum development plans, Cost-benefit analysis, Mathematical models, Systems analysis, *Canada, *Multiple-purpose projects.
Identifiers: *Okanagan River Valley(British Columbia), Multiple objectives, Economic development, Environmental quality, Social well-being.

Canada and British Columbia signed an Agreement to develop a comprehensive framework plan for water resources management in the Okanagan Valley. The Agreement explicitly recognizes the multiple goals of economic growth and social betterment, indicating that it is based on the concept of multiple objective planning and that a more comprehensive approach to evaluation of alternative plans than the traditional cost-benefit analysis is required. Explored are the implications of a new, comprehensive river basin planning strategy on the evaluation process, and an empirical approach for establishing an evaluation matrix to compare alternative plans is described. The planning process associated with the Okanagan Basin Study is discussed, and the multiple goals are examined. Identified are the major consumptive and non-consumptive uses in terms of water quantity management, associated planning objectives are specified for present and future conditions, and each of the principal steps in the evaluation process is examined. Described is a simulation model of the mainstem system closely representing the observed pattern of inflow, developed to standardize the evaluation process. The process purpose is to determine the degree to which alternatives achieve planning objectives for specified user areas. Development of an evaluation matrix involves 3 steps-impact analysis; comparison with zero alternative; and weighting schemes--and should provide decision-makers with an information system enabling them to make a clear choice. 6B. Evaluation Process

INDIANA 1950-1970: LIFE TABLES FOR THE 14 ECONOMIC REGIONS AND ANALYSIS WITH MEASURES OF MEDICAL CARE,
Purdue Univ., Lafayette, Ind.
E. R. Cooper.
Available from National Technical Information Service as PB-230 488, $12.50 in paper copy; $1.45 in microfiche. M. Sc thesis 1972, 172p, 44 tab, 26 ref, 3 append. OWRR-C-3277-(3713) (2).

Descriptors: *Human population, *Rural areas, *Urban areas, Cities, Population, *Indiana, Longevity, Age, Mortality.
Identifiers: Life tables, *Life expectancy, Demography, Infant mortality, Urban population, Physicians, Hospital beds, Hospital patients, *Medical care.

Life tables were constructed for the 14 economic regions of Indiana in census years 1950 through 1970. Dependent variables were the following life table functions: infant mortality, expectation of life at birth, and expectation of life at age 65. Independent variables were urban population and the measures of medical care; physicians, hospital beds, patients admitted, patient days, occupancy rate for hospitals, and usage rate for hospitals. In 1950 there were urban-rural differences. However, it is significant that mortality is lower and expectation of life higher in the more rural economic regions. There were no urban-rural differences in 1960 or 1970, yet the variation in mortality and expectation of life among the economic regions increases. There is greater variation among the regions in 1970 than in 1950. Among the economic regions the larger the quantities of the four medical care variables the higher is mortality and the lower is expectation of life.

AN ANALYTICAL INTERDISCIPLINARY EVALUATION OF THE UTILIZATION OF THE WATER RESOURCES OF THE RIO GRANDE IN NEW MEXICO: SOCORRO REGION,
New Mexico State Univ., University Park. Dept. of Agricultural Economics.
R. R. Lansford, S. Ben-David, T. G. Gebhard, Jr., W. Brutsaert, and B. J. Creel.
Available from the National Technical Information Service as PB-230 615; $4.50 in paper copy, $1.45 in microfiche. New Mexico Water Resources Research Institute, Las Cruces. Partial Technical Completion Report No. 023, 1974. 95 p, 15 fig, 37 tab, 70 ref. OWRR A-045-NMEX(4).

Descriptors: *New Mexico, *Water utilization, *Water demand, Economics, *Water resources development, Management, *Economic predictions, *Surface-groundwater relationships, Natural resources, Water requirements, Resource allocation, River basins, Groundwater management, Water law, Interstate compacts, International compacts, Treaties, Litigation, Water quality, Water utilization, Human population, Employment, Industrial water, Recreation.
Identifiers: *Rio Grande Basin, *Socio-economic models, Groundwater appropriation, Input-output coefficients, Conjunctive use models, Economic land classification, Groundwater models, Irrigation water diversions, *Socorro Region(N.Mex).

An interdisciplinary approach to the solution of the water resource problems of the Socorro Region in New Mexico was centered around a socioeconomic model, developed to represent the New Mexico economy, with special emphasis placed upon the Rio Grande region. Inputs into the socio-economic model were obtained from separate studies. Three sets of alternatives were considered: (1) Without a water constraint, in the Rio Grande region, both production and depletions are expected to exhibit the largest increase (59.7 percent and 47.4 percent, respectively); (2) When a surface-water constraint is imposed, the value of production is reduced by $18.1 million in 2020 and water depletions are expected to decrease about 18.1 percent by 2020; (3) When a total water constraint is imposed, the value of production is decreased $4.1 million below that expected when using only a surface-water constraint, and water depletions are reduced about 8.4 percent. The Socorro Region is expected to follow the general trend of the total Rio Grande region but at a lower growth rate. The expected increase in total value of production from 1970 to 2020 is 46.8 percent, employment about 21 percent. When a surface-water constraint is imposed, production is expected to be reduced $0.6 million in 2020, employment by 49 employees, and water depletions by 8,918 acre-feet. When an additional constraint is imposed on ground water in the Socorro Region, production would be decreased $1.0 million in 2020, employment by an additional 107 employees, and water depletions by 533 acre-feet. (Hain-New Mexico)

MULTIPLE PLANNING FOR MULTIPURPOSE WATER RESOURCE SYSTEMS: A STRUCTURE FOR REGIONAL WATER RESOURCE DEVELOPMENT,
INTASA, Menlo Park, Calif.
D. P. Lijesen, A. P. Delarue, J. Rosing, L. T. Brekka, and J. L. Poage.
Available from the National Technical Information Service as PB-230 619; $6.00 in paper copy, $1.45 in microfiche. Completion Report, November 1973. 213 p, 38 fig, 33 tab, 61 ref. OWRR C-4264(9042)(1).

Descriptors: *Planning, Land use, Comparative costs, *Multiple purpose projector, *Cost sharing, Benefits, Recreation, *Water supply, *Reservoir design, *Regional analysis, *Management, Recreation demand, Flood control, *Alternative planning, Systems, Assessments, Evaluation, Economics, Social aspects, Environmental effects, Research priorities.

Six key phases are identified for the integrated process of planning and evaluation of multiple purpose, multiobjective water resource systems: Need identification, formulation of alternative systems, assessment of impacts, evaluation, display and implementation. Within the process, three major problem areas which contribute significantly to the complexity of the process are identified, analyzed and illuminated through the use of carefully selected case studies. These problem areas: interdependencies between planning objectives and the implications for project planning and evaluation; interdependencies between purposes and the implications for project design and planning; financial interdependencies and implications of cost sharing rules on multilevel decision making as related to the implementation phase. The case studies currently in the planning stage are used to demonstrate three practical planning tools: comparative analysis of alternative land use plans used to delineate economic and social impacts of different land uses and analyze their implications for water resource planning; tradeoff analysis used to assess the importance of benefit tradeoffs between flood control and urban recreation; senitivity analysis used to determine necessary changes in the design and operation of a system designed primarily for water supply in order to better accomodate other purposes. Finally, a stepwise procedure for planners is given, together with an outline of priority research areas. (Davenport-INTASA)

WATER ZONING: THE MANAGEMENT OF SURFACE ACTIVITY ON LAKES, STREAMS, RIVERS AND BAYS,
Michigan Univ., Ann Arbor. Shorelands Management Unit.
P. C. Ryner.

Available from the National Technical Information Service as COM 73-11078; for $3.00 in paper copy, $1.45 in microfiche. Michigan University Sea Grant Program Publication MICHU-SG-73-101 (SMG-1), March 1973. 15 p.

Descriptors: *Michigan, *Recreation demand, Swimming, Fishing, Lake Michigan, *Zoning, Water sports, Boating, Social impact, Regulation, Water policy, *Water management(Applied).
Identifiers: Water zoning.

Many lakes and rivers of Michigan are reaching a point at which some form of regulation and control might be considered. Wherever people enjoy water activities, crowded conditions are now a frequent and perhaps all too familiar situation. This situation is not confined to the summer months; increasingly, it is also a winter problem, as numerous vehicles, some of them capable of reaching high speeds, take advantage of the considerable ice fields found throughout the state. One way of eliminating conflicts is to designate specific areas or zones for individual activities. If enjoyable recreation is to continue, density regulations may be necessary for most water and shore areas. The concept of water zoning can deal with only some of the complex issues facing both the Great Lakes and the inland waters of the state of Michigan. (Knapp-USGS)

RIVER BASIN PLANNING AND THE FOREST INDUSTRY--COMPROMISE OR CONFLICT,
Saint John River Basin Board (New Brunswick).
J. M. Henderson, and R. B. B. Dickison.
Pulp and Paper Magazine of Canada, Vol 74, No 11, p 32-34, Nov 1973. 1 map.

Descriptors: *River basin development, *Pulp and paper industry, *Canada, *Maine, Water resources development, *Water management(Applied), River Basin Commissions, Biochemical oxygen demand, Water pollution sources, Pollution abatement, Pulp wastes, Optimization, *Planning.
Identifiers: *Saint John River Basin, New Brunswick, Forest products industry.

In the St. John River Basin area, the pulp and paper industry contributes 25% of all jobs, but also 75-80% of all man-made BOD in the stream. Model studies indicate that even a 90% reduction of BOD may overload the river at low flow. A plan for managing this important water resource of East Canada and Maine has been developed by the St. John River Basin Board. It aims at optimizing the balance of present and future water user demands with the available supply. The Board is comprised of three Federal and three Provincial (New Brunswick) government representatives and aided by an Advisory and Liaison Committee. It solicits the paper industry's cooperation in multiple-use planning of land, especially forested lands, without endangering the industry's competitiveness in foreign markets. (Brown-IPC)

THE HYDROLOGICAL EVALUATION OF REGIONAL WATER-RESOURCE SYSTEMS IN THE UNITED KINGDOM,
Water Resources Board, Reading (England).
D. G. Jamieson, and J. R. Sexton.
In: Proceedings (Vol III), The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 23 p, 7 fig, 1 tab, 2 ref.

Descriptors: Water resources development, Hydrology, *Design, *Simulation analysis, *Reservoirs, Reliability, *Evaluation, Operating costs, Methodology, Pumped storage, Rivers, Estuaries, Mathematical models, Systems analysis, Economics, *Regional analysis.
Identifiers: River Great Ouse(England), *United Kingdom.

A method referred to as two-phase simulation is proposed for the hydrological design of complex water resource systems. Water projects based on the integrated use of systems comprising reservoirs, aquifers, rivers, and aqueducts are being planned in England and Wales. At the design stage, a limited number of alternative patterns of development must be evaluated in considerably more detail than is possible at the planning stage. The scale of the problem and the complexity of such analysis necessitate the use of simulation. In two-phase simulation, the first stage is simulation of the river flows, and the second phase is simulation of the proposed reservoir system. The river-flow simulator derived in the first phase is embedded in the secondary phase and the resulting simulation of the complete water resource system is run for a long period of record. Performance of the complete system in terms of reliability of meeting the forecast water requirements and operating costs is summarized in a form convenient for input to the economic evaluation. This method is being used for the hydrological design of the Wash Storage, a pumped-storage reservoir scheme in the estuary of the River Great Ouse in southeast England. (Bell-Cornell)

PROBLEMS AND IMPLICATIONS IN THE DEVELOPMENT OF ARID LANDS,
Hebrew Univ., Jerusalem (Israel). Dept. of Geography.
D. H. K. Amiran.
In: Coastal Deserts, their natural and human environments, ed. by D.H.K. Amiran and A.W. Wilson. University of Arizona Press, 1973. p 25-32, 2 tab, 11 ref.

Descriptors: *Arid lands, *Arid climates, *Land development, *Deserts, Land reclamation, Semiarid climates, Dry seasons, Land use, Land management, Management, Planning, Project planning, Future planning(Projected), Decision making, Regional development, Water resources management.

Because of their dissimilarities, world arid zones present different developmental problems, to which increasing attention is directed because of population pressures and a decreasing supply of commodities. Because non-indigenous immigrants into the arid zones bring with them environmental concepts more related to the humid areas from which they came, some developments are self-defeating. Basic to arid zone development, then, is an understanding of the limited resources and a full recognition of the consequences of environmental engineering. Priorities must be established, long-term planning undertaken, and educational programs in support of decisions that may be uncomfortable, are necessary components of proper development of the world's arid zones. (Muller-Arizona)

THE CHANGING ROLE OF WATER IN ARID LANDS,
Colorado Univ., Boulder. Inst. of Behavioral Science.
G. F. White.
In: Coastal Deserts, their natural and human environments, ed. by D.H.K. Amiran, and A.W. Wilson, University of Arizona Press, Tucson, 1973. p 37-43.

Descriptors: *Arid lands, *Semiarid climates, *Water demand, Water resources development, Deserts, Desalination, Demineralization, Impaired water quality, Saline water, Water supply, Water sources, Land development, Urbanization, Community development, Water utilization, Agriculture.

As the demand for the utilization of less and less hospitable land is increased by increasing population, the population of the land changes. Development of such lands, usually arid, starts from the natural state, through various phases of agriculture to urbanization. Agricultural demand on an arid system increases as production is expanded. This is usually accompanied by an increase in population, and corresponding establishment of small urban and recreational demands on the region. Further urbanization causes competition between urban and agricultural users. This is illustrated in the dry southwestern United States where initially agrarian communities have grown and industrialized. In such situations the demand for water from all competing uses exceeds available supply, necessitating the establishment of priorities. Unless these priorities are made with a consideration for the attitude of the public toward water, the resulting development can be expected to offer meager returns. The need for water budgeting, for fair pricing of water and for a re-examination of water programs is emphasized. It is concluded that developments in modern technology such as saline water conversion or development of salt tolerant crops, are not sufficient to make arid areas productive without alterations in the perception of water by the inhabitants of these regions. Descriptors: *Coasts, *Arid climates, *Climatic data, Arid lands, Atmospheric pressure, Climatic zones, Meteorology, Droughts, Orography, Precipitation(Atmospheric), Temperature, Topography, Weather data, Winds, South America.
Identifiers: *Peru, *Atmospheric inversions, Trade winds.

Wind patterns cannot account for the equi-latitudinal distribution of the coastal deserts of the world. These should actually be considered as being equidistant from the equitorial trough or low, rather than from the equator. For this reason the dry areas of Peru may be considered anomalous on the global setting. The winds of the region are found to be predominantly parallel to the coastline. Temperature inversions are also noted, caused by subsidence-induced adiabatic heating from above and cooling from below. These inversions are the key to climate of the area. They occur in two distinct patterns. A detailed description is presented of the characteristics of the inversions, the associated atmospheric humidity, cloud cover, precipitation and temperature for both the trade wind inversions of the winter (May 16 through September 30) and of the summer (January 1 through May 15) for the study year 1967. The sudden transition from the two inversionary types is noted. The particularly abrupt transition from summer to winter conditions on May 16,1967 is documented. These rapid changes are attributed to the correspondingly rapid changes in the trade wind pattern. A short discussion of the El Nino anomalous phenomenon is also included. (Muller-Arizona)

Paris Univ. (France). Dept. of Geography.
J. Despois.
In: Coastal Deserts, their natural and human environments, ed. by D. H. K. Amiran and A. W. Wilson. University of Arizona Press, Tucson, 1973, p 167-169. 14 ref.

Descriptors: *Deserts, *Economic impact, *Social impact, Industrial production, Water resources, Income distribution, Agriculture, Population, Aquifers, Artesian wells.
Identifiers: *Sahara Desert, *Oases.

The impact of industrial developments in the Sahara on the traditional life, culture, and agriculture of its oases is analyzed. Advances in oil, gas, and iron ore production since the mid nineteen fifties, plus the implementation of better transport have revolutionized the social structure without adequate preparation for the drastic changes involved. The traditional subsistence economy has been disturbed by a money economy, emphasizing endemic social inequities. A fluctuating population characterized by a dangerous increase further aggravates the situation, while the return of a substantial number of those originally attracted away from oasis life has failed to provide the support required to improve agriculture or livestock. Problems appear to center around how to save the traditional economy of the oases, how to integrate it into the modern economy, and how to aid farmers and livestock owners so that they benefit from the new economy and technology instead of being victimized by such developments. In the southern Sahara especially, where the number of artesian wells has increased and where a rich aquifer of deep water has been discovered, crop production could be increased, with a ready-made market in new mining centers. Some mechanism is needed to make a return to an improved agriculture attractive to a new generation lured away. A plea is made for a return to oasis life, enhanced by modern technology that will create educational, employment, and social benefits. Otherwise, the outlook, not only for oases inhabitants but for those urbanites dependent on the former products of oases, is a gloomy one. (Paylore-Arizona)

EILAT: SEASIDE TOWNS IN THE DESERT OF ISRAEL,
Hebrew Univ., Jerusalem (Israel). Dept. of Geography.
D. H. K. Amiran.
In: Coastal Deserts, their natural and human environment, ed. by D. H. K. Amirand and A. W. Wilson. University of Arizona Press, Tucson, 1973, p 171-175. 3 fig.

Descriptors: *Coasts, *Decision making, *Planning, *Urbanization, Deserts, Water supply, Desalination plants, Regional economics, Water resources development, Land management, Mining, Natural resources, Fishing, Arid climates, Arid lands, Climate, Tourism.
Identifiers: *Israel(Eilat).

Eilat, located at the southern end of the rift valley of the Dead Sea, is the southernmost community of Israel and its only Red Sea port. The foundation of the town in biblical times was probably due to the availability of groundwater. It has an arid desert climate characterized by high summer temperatures and low precipitation. Employment is based on either the development of natural resources or service to the town of Eilat itself. When available groundwater, both locally pumped and transported, was exceeded by water demands, a dual-purpose desalination and electrical generating plant was established, and currently an experimental crystalization type desalination plant is being developed. Eilat's three natural assets, mineral resources, fishery, and desert climate, offer the best opportunities for economic development, with only limitations stemming from the remoteness of Eilat from the centers of economic activity in Israel. An oil refinery is also proposed for the area but since construction would be severely detrimental to fishing and to the tourist industry, the choice in the establishment of the plant is critical to the future of Eilat. ECONOMIC DEVELOPMENT OF THE AUSTRALIAN COASTAL DESERTS,
Western Australia Univ., Nedlands.
J. Gentilli.
In: Coastal Deserts, their natural and human environments, ed. by D. H. K. Amiran and A. W. Wilson. University of Arizona Press, Tuscon, 1973, p 189-204. 6 fig, 2 tab, 43 ref.

Descriptors: *Australia, *Coasts, *Regional economics, *Meteorological data, *Weather patterns, Surveys, Transportation, Desalination, Fisheries, Mineral industry, Harbors, Water wells, Winds, Crops, Irrigation.

Five subregions of the northwestern littoral of the Australian continent are discussed, with a brief mention of the less extensive area, the southern littoral. Meteorological conditions as they affect the economic development of the area are described, with tables showing the rainfall patterns, agricultural activities, and transport data. Historical information includes development of various industries, especially mineral, fisheries, and vegetable crops; demographic information; and some generalized attention to a synoptic analysis of the region as a whole. Water losses in areas devoted to commercial agricultural production occur through action of persistent southerly winds of summer; irrigation practices to offset these losses are described. In the Shark Bay-Carnavon area the main source of income is irrigated agriculture dependent on pumped and shallow wells tapping groundwater, and from concrete-lined wells in the Gascoyne River bed. Also described is the desalination plant at Dampier using waste heat from a power station to produce potable water for a variety of needs. (Paylore-Arizona)

THE COLUMBIA INTERSTATE COMPACT: POLITICS OF WATER RESOURCES IN THE PACIFIC NORTHWEST,
Washington State Univ., Pullman. Dept. of Political Science.
H. R. Doerksen.
Available from the National Technical Information Service as PB-230 484, $17.75 in paper copy, $1.45 in microfiche. PhD thesis, 1974. 276 p, 2 fig, 35 tab, 108 ref, 3 append. OWRR A-055-WASH (2), 14-31-0001-3848.

Descriptors: Administrative agencies, *Columbia River, *Pacific Northwest, Washington, Water resources development, *Interstate compacts, *Regional development, Political aspects, Institutional constraints, *Political constraints.
Identifiers: *Columbia Interstate Compact.

The Columbia Interstate Compact represented an attempt to establish a regional institutional mechanism for river basin development. After seven Pacific Northwest states spent 18 years negotiating the Compact, and five attempts were made to ratify the Compact in the state legislatures, Oregon and Washington had not ratified. This study is a history of the Compact negotiations, describing the efforts of the seven states in the context of the political environment in which the Compact was negotiated. Several factors which contributed to the ultimate dissolution of the negotiating effort are analyzed in some depth. First, role perciptions (sense of negotiating objectives) of Compact commissioners varied substantially from state to state and within states in a period of time when attitudes related to river basin development were typically strong and polarized. Second, the negotiating environment changed in such a way as to reduce the preceived need for a Compact. Finally, financial crisis, after Washington, and Oregon discontinued financial support of the effort, forced the Compact Commission to close its office. The most devastating defeat of the Compact attempt came in the Washington Legislature. There the Compact became embroiled in the existing conflict regarding power generation and marketing. Although the Compact effort may be dead, most issues with which it dealt, including allocation of water, reservation of power for states in which a dam is constructed, and out-of-basin diversion, are very much alive.

FEDERAL AND STATE LEGISLATIVE HISTORY AND PROVISIONS FOR LAND TREATMENT OF MUNICIPAL WASTEWATER EFFLUENTS AND SLUDGES,
Environmental Protection Agency, Washington, D.C. Office of Water Program Operations.
R. H. Sullivan.
In: Recycling Municipal Sludges and Effluents on Land; Proc of Joint Conference, July 9-13, 1973, Champaign, Illinois: National Association of State Universities and Land-Grant Colleges, Washington, D.C. p 1-7, 1973. 2 tab.

Descriptors: *Waste disposal, *Waste water disposal, Water law, *Sludge disposal, *Recycling, *Legislation, Federal government, Regulation, State governments, Landfills, Public health, Research and development, Water pollution control, *Water reuse.
Identifiers: Land disposal(Wastes).

Both Federal and State legislation and regulations related to land treatment are in a state of development. The current situation and the range of actions possible under present rules are discussed. The results of research and development, demonstration projects, and working installations will help to determine future legislation and regulations. The Federal government has traditionally left the jurisdiction of this activity in the province of State and local governments, as essentially a public health matter. However, the large amount of Federal grant funds that have been made available, concern about the total environment, and Federal laws and regulations on land, water, and air quality have combined to make the Federal government active in financing and evaluating effective land treatment of municipal effluents and sludges. State and local governmental units have also shown increasing interest in land treatment of effluents and sludges, both as a desirable method of wastewater treatment under appropriate conditions and as a public health matter which needs guidance and regulation. MORGAN CITY PUBLIC HEARING TESTIMONY.
Louisiana Advisory Commission on Coastal and Marine Resources, Baton Rouge.
November 9, 1972. 18 p.

Descriptors: *Water resources development, *Coasts, *Coastal marshes, *Water conservation, *Water supply, *Louisiana, Area redevelopment, Project planning, Water resources, Water demand, Wildlife conservation, Recreation, Water rights, Competing uses, Water policy, Natural resources, Environmental effects.

The Mayor of Morgan City outlined various needs which he hoped the Louisiana Advisory Commission on Coastal and Marine Resources would investigate. He felt the coastal areas needed greater highway accessibility, and more deep water channels open to the Gulf if they are to maintain an economically competitive position. He felt the natural resources should be preserved to the fullest extent possible, especially mentioning a sufficient fresh water supply as well as maintaining the Atchafalaya Basin for recreation and commercial fisheries. The State Land Office felt the primary concern should be to legalize and control encroachment on state-owned waters. The Wild Life and Fisheries Commission felt the greatest need was for preserving the wetlands in their natural state, as they provide a source of livelihood for many citizens and contribute greatly to the state's economy, and also for the recreational benefits they provide. The main concern of a marine surveyors organization was the great need for an adequate fresh water supply. (Sutton-Florida)

THE CONTINENTAL SHELF LANDS OF THE UNITED STATES: MINERAL RESOURCES AND THE LAWS AFFECTING THEIR DEVELOPMENT, EXPLOITATION, AND INVESTMENT POTENTIAL,
North Carolina Univ., Chapel Hill. School of Public Health.
E. Dahle, Jr.
Available from National Technical Information Service, Springfield, Va, 22151, as COM-73-11340, $3.75 in paper copy, $1.45 in microfiche. University of North Carolina Sea Grant Publication UNC-SG-73-11, June 1973. 80 p, 397 ref. NOAA SG04-3-158-40.

Descriptors: *Law of the sea, *Legislation, *Continental Shelf, *Marine geology, *Investment, *Mineralogy, Oceanography, Sea water, International waters, Oil industry, Economics, Mineral industry, Exploration, Water resources, Legal aspects, Oceans, International law, Federal government, State governments.

An overview is presented of the United States' Continental Shelf legislation with special emphasis placed on the development and exploitation of the Shelf's mineral resources. Legal factors influencing investment in ocean industries are evaluated. Part I of this study provides a working knowledge of the Shelf's physical characteristics and its present delimitation. Part II presents an overview of the mineral resources known to exist in such areas including oil, hard rock minerals and minerals concentrated in marine organisms, to increase awareness of both the current and potential value of the U.S. shelves. The third part of the study analyzes private investment from both the corporate and individual standpoint, and an effort is made to expose both the benefits and drawbacks inherent in such investment. Part IV analyzes nationwide legislation affecting the development and exploitation of these mineral resources, with separate treatment of federal and state legislation. In Part V current legal developments at the international level are brought into perspective, including organizations whose purpose is to coordinate marine activities and pollution control. CIBOLO PROJECT, TEXAS.
Hearing--Subcomm on Water and Power Resources, Comm on Interior and Insular Affairs, U.S. House of Representatives, 93d Cong, 1st Sess, June 22, 1973. 70 p.

Descriptors: *Texas, *Legislation, *Water supply, *Government financing, *Groundwaters, Water allocation(Policy), Planning, Dams, Reservoirs, Water demand, Water requirements, Water resources development, Fish management, Wildlife management, Recreation, Flood control, Water loss, Evaporation, Structures, Feasibility studies, Cost allocation, Environmental engineering, Water distribution, Industries, Municipalities, Water utilization.
Identifiers: *Cibolo project(Tex).

These hearings were held in San Antonio, Texas, for the purpose of obtaining a firsthand report from the people of Texas on their feelings regarding the Cibolo project. A feasibility study of the Cibolo project was begun in 1964 in an effort to devise a comprehensive program to manage the combined surface and ground water resources in the San Antonio area. The project will consist of Cibolo Dam and Reservoir, purchase of adjacent lands for recreation, construction of recreational facilities, and accomplishment of recommended fish and wildlife management measures. The estimated cost of the project is in excess of forty million dollars. The project would provide substantial municipal and industrial water supply, flood control, recreation and fish and wildlife benefits. Statements were entered into the record by Congressmen, state legislators, mayors of nearby municipalities, and various other public officials, One witness noted that the economic development of the area would be greatly enhanced through the availability of a surface supply to augment existing sources. A Sierra Club representative, however, denounced the project as a stop-gap measure to patch up the water supply of an already overpopulated area. (Ritchie-Florida)
W74-06004

PROPOSED BIG CYPRESS RESERVE, FLORIDA.
Hearings--Before the Subcommittee On National Parks And Recreation of the Committee On Interior and Insular Affairs, U.S. House of Representatives, 93d Cong., 1st Sess., May 10, 11, 1973. 209 p, 3 fig, 3 map, 3 tab.

Descriptors: *Federal government, *Florida, *National parks, *Watershed management, *Budgeting, Decision making, Public lands, Watershed protection, Water conservation, Project planning, Water policy, Recreation demand, Recreation facilities, Surface run-off, Subsurface water, Ground water recharge.
Identifiers: *Congressional hearings.

Among witnesses were the governor of Florida, Congressional representatives, concerned landowners, conservation associations, and corporate officials. Between $150 million and $175 million is needed for the Big Cypress Reserve in Florida, and several representatives state their fears that the project will not be funded even though it is already authorized because the President's budget does not include any funds for federal recreation land acquisitions. The Big Cypress area is critical as a part of the watershed nourishing the northwestern portion of the Everglades National Park, providing more than half the surface flow water for the Everglades National Park. The Big Cypress also recharges ground water, which is the principal domestic water source in central Florida and it also is one of the last refuges for a number of endangered species. Additionally, it can support an increasing number of people seeking recreation. (Sperling-Florida)
W74-06005

A SUMMARY-DIGEST OF STATE WATER LAWS.
National Water Commission, Arlington, Va.
Available from Superintendant of Documents, U.S. Government Printing Office, Wash., D.C., for $4.55. Order no. Y3.N21/2L44/2. 1973. R. L. Dewsnut, D. W. Jensen and P. W. Swenson, editors.

Descriptors: *Legislation, *Water law, *Judicial decisions, *Governments, *State governments, Administrative agencies, Legal aspects, Regulation, Riparian rights, Water utilization, Water rights, Navigable waters, Boundaries(Property), Institutions, Management.

A summary-digest is presented of the water laws of the 50 states, their statutes, court decisions, and administrative arrangements. Special emphasis is put on the acquisition, use, transfer, and management of water rights. The volume consists of a general survey of state water law doctrines and institutions including development, nature, organizational structure, and special subjects. It also contains fifty chapters, with each chapter devoted to the laws of one of the fifty states, and, each chapter is subdivided into development, organization, surface waters, and ground waters. At the end of each chapter a list of related publications is included. (Conko-Florida)
W74-06006

WATER RESOURCES DEVELOPMENT--1973.
Hearing--Before the Subcommittee on Water Resources of the Committee on Public Works, U.S. House of Representatives, 93d Cong., 1st Sess., May, June 1973. 1443 p.

Descriptors: *Federal government, *Project planning, *Water conservation, *Water resources, Legislation, Political aspects, Water supply, Flooding, Flood protection, Water injury, Harbors, Flood damage, Recreation, Electric power plant, Decision making.
Identifiers: *Congressional hearings.

Testimony was taken from the Association of Port Authorities, interested environmental groups, Congressmen, and the Army Corps of Engineers. The first day of hearings concerned proposed rivers and harbors and flood control projects of the U.S. Army Corps of Engineers. The value of these projects was recently shown in Mississippi where in its worst flood in two hundred years over $400 million in damages occurred, and in excess of ten million acres was inundated. Without the project, damages would have exceeded $6 billion and twenty-seven million acres would have been flooded. Last year's flood control bill was vetoed by the President, but similar identical legislation has been reintroduced. This committee is responsible for providing for flood control, navigation, water supply, power, recreation, and conservation of the nation's water resources. (Sperling-Florida)
W74-06007

PUBLIC WORKS FOR WATER AND POWER DEVELOPMENT AND ATOMIC ENERGY COMMISSION APPROPRIATION BILL, 1974 PART 3.
Hearings--Subcomm of the Committee on Appropriations--House of Representatives, 93d Cong., 1st Sess., March 21, 1973. 1231 p.

Descriptors: *Southeast U.S., *Hydroelectric power, *Federal government, *Administrative agencies, *Federal budgets, Federal Power Act, Federal Reclamation Law, Legislation, Hydroelectric plants, Water resources development, Government finance, Political aspects.
Identifiers: Congressional hearings.

The Department of the Interior's budgetary requests for the fiscal year 1974 were the subject of these hearings. Officials of the various projects administered by the Department testified in support of their respective budgetary requests. The major part of the testimony dealt with Department projects involving the production of hydroelectric power in different parts of the country. Included therein was the Southeastern Power Administration. Testimony was also presented in support of the appropriation sought for the Water Resources Council. Numerous charts and maps were included showing the costs of the various projects conducted by the Department as well as the benefits to be derived from them. Most of the projects concerned in the hearings were ongoing projects of the Department of the Interior. (Flowers-Florida)
W74-06008

OFFSHORE MARINE ENVIRONMENT PROTECTION ACT OF 1973, FIRST SESSION ON S.80.
Hearings--Comm. on Commerce--United States Senate, 93d Cong, 1st Sess, March 5, 6, and 12, 1973. 335 p, 22 fig, 7 map, 10 illus, 21 photo, 10 tab.

Descriptors: *Environmental protection, *Coastal structures, Waterways, Construction, Coastal waters, Environmental effects, Navigation, Safety, Legislation, United States, Coastal engineering, Shore protection, Shores, Coasts.
Identifiers: Congressional hearings, Coastal zone management.

This is the first of three hearings on the subject of offshore artificial structures and the need for their regulation and control. The bill's purpose is to coordinate the full evaluation of potential impact on the marine environment of the construction of large-scale offshore artificial structures. Safety of navigation is an additional concern. The bill will amend the Ports and Waterways Safety Act of 1972 which provided for authority to be placed in the National Oceanic and Atmospheric Administration for the certification of the environmental soundness of the site selection, construction and operation of offshore artificial structures for port and terminal, powerplant, airport, and other such facilities to be located in the coastal waters. A BILL TO CREATE AN UPPER MISSISSIPPI RIVER RECREATIONAL AREA.
House Bill 11603, 93d Cong, 1st Sess (1973). 15 p.

Descriptors: *Legislation, *Recreation, *Mississippi River, *Project planning, Illinois, Iowa, Minnesota, Missouri, Wisconsin, Interagency cooperation, Conservation, Land management, Land use, Natural resources, Recreation facilities, Government finance, Penalties(Legal), Environment, Preservation, Fish, Wildlife, Comprehensive planning.

In order to conserve and protect in their natural state certain areas of land and water in and along the Upper Mississippi River, and to develop such areas for recreational use of the public, there is authorized the Upper Mississippi River National Recreation Area. The area shall include the Mississippi River and portions of the first tier of counties along the river in the states of Illinois, Iowa, Minnesota, Missouri and Wisconsin, and shall comprise no more than 650,000 acres of land and water. The Secretary of the Interior shall establish the area by publication of notice at such time as he determines that sufficient lands, waters or interests therein are in public ownership and provide an efficiently administrable unit. The Secretary is also authorized to acquire those lands, waters and interests therein proposed for acquisition by the master plan. There is also established an Upper Mississippi River National Recreation Area Council, to be composed of thirteen members, who shall assist the Secretary in developing a master plan for the project. (Ritchie-Florida)
W74-06175

A BILL TO AMEND THE FISH AND WILDLIFE COORDINATION ACT, AND FOR OTHER PURPOSES.
House Bill 10651, 93d Cong, 1st Sess (1973). 8 p.

Descriptors: *Legislation, *Fish, *Wildlife, *Wildlife habitats, *Wildlife conservation, Interagency cooperation, Wildlife management, Streams, Bodies of water, Legal aspects, Government finance, Impounded water, Channelization, Permits, Regulation, Environmental effects.

Whenever the waters of any stream or other body of water are proposed to be impounded, diverted, widened, deepened or otherwise modified by any federal agency, such agency shall first ascertain the probable effect of the project on wildlife. This shall be done by consulting with the United States Fish and Wildlife Service, the National Oceanic and Atmospheric Administration, and the state agency which has administrative authority concerning the affected wildlife resources, as well as obtaining a report from the Secretary of the Interior and the Secretary of Commerce. This report shall include the effects attributable to the project on wildlife resources and the measures that should be adopted to prevent damage to wildlife resources and provide for enhancement of such resources. Any citizen may commence a civil action on his own behalf against any person, including the United States, who is alleged to be in violation of any provision of this Act or any regulation established pursuant to this Act. (Ritchie-Florida)
W74-06176

A BILL TO AMEND THE ACT OF AUGUST 3, 1968, RELATING TO THE NATION'S ESTUARIES AND THEIR NATURAL RESOURCES, TO ESTABLISH A NATIONAL POLICY WITH RESPECT TO THE NATION'S BEACH RESOURCES.
House Bill 10394, 93d Cong, 1st Sess (1973). 8 p.

Descriptors: *Legislation, *Legal aspects, *Beaches, *Public rights, *Public access, Coasts, Oceans, Recreation, Vegetation, Natural resources, Riparian land, Riparian rights, Estuaries, Government financing, Construction, Structures, Eminent domain, Transportation, Land use, Land management, Land development, Federal government.
Identifiers: *Injunctive relief.

This bill, amending 16 U.S.C. 1221 et. seq., relating to the Nation's estuaries and their natural resources, is to establish a national policy with respect to the Nation's beach resources. 'Beach' is defined as the area along the shore of the sea affected by wave action directly from the open sea. It is more precisely defined as, in the case of typically sandy or shell beach with a discernible vegetation line, it is that area which lies seaward from the line of vegetation to the sea, or in the case of a beach having no discernible vegetation line, the beach shall include all area formed by wave action not to exceed two hundred feet in width. The public shall have free and unrestricted right to use the beaches as a common, consistent with constitutionally protected property rights of littoral landowners. No person shall erect or maintain any obstruction which interferes with the unrestricted right of the public to enter or use as a common the public beaches. An action shall be cognizable to establish and protect the public right to beaches, determine the existing status of title, and condemn such easements as are necessary to effect the purposes of this title. The Secretary of the Interior is authorized to make grants to the states to carry out this title. (Ritchie-Florida)
W74-06177

A BILL TO AMEND THE PROJECT FOR FLOOD PROTECTION ON INDIAN BEND WASH, MARICOPA COUNTY, ARIZONA, AUTHORIZED BY THE FLOOD CONTROL ACT OF 1965.
House Bill 10135, 93d Cong, 1st Sess (1973). 1 p.

Descriptors: *Legislation, *Government financing, *Arizona, *Canals, *Siphons, Irrigation, Construction, Structures, Flood protection, Flood control, Project purpose.
Identifiers: Flood Control Act of 1965, Arizona Canal.

The project for flood protection on Indian Bend Wash in Maricopa County, Arizona which was authorized by the Flood Control Act of 1965, is modified to provide that the siphon system from the Arizona Canal, required to be provided in connection with the relocation of irrigation facilities, shall be furnished at full federal expense. (Ritchie-Florida)
W74-06178

A BILL TO EXPAND THE NATIONAL FLOOD INSURANCE PROGRAM BY SUBSTANTIALLY INCREASING LIMITS OF COVERAGE AND TOTAL AMOUNT OF INSURANCE AUTHORIZED TO BE OUTSTANDING AND BY REQUIRING KNOWN FLOOD PRONE COMMUNITIES TO PARTICI PATE IN THE PROGRAM AND FOR OTHER PURPOSES.
House Bill 8449, 93d Cong, 1st Sess (1973). 15 p.

Descriptors: *Legislation, *Floods, *Flood plains, *Flood plain insurance, *Flood plain zoning, Flood damage, Non-structural alternatives, Government finance, Legal aspects, Regulation, Land use, Flood protection, Construction, Mud flows, Land management, Soil conservation, Groundwater recharge, Surface-groundwater relationships, Federal government.

Annual losses throughout the nation from floods and mudslides are increasing as a result of the accelerating development of, and concentration of population in, areas of flood and mudslide hazards. It is in the national interest, therefore, to preserve, protect, develop and restore the flood capacity and resources of the nation's flood plain areas and to maintain the natural environment of such areas. The purpose of this act is to substantially increase the limits of coverage authorized under the national flood insurance program, provide for the identification of flood-prone areas, encourage the establishment of conservation areas, and encourage the formulation of flood-plain ordinances. No federal agency shall approve financial assistance for acquisition or construction in any area identified as having special flood hazards unless the project is covered by flood insurance in an amount at least equal to its development or project cost. In addition, no federal agency shall approve financial assistance for use in any area identified as having special flood hazards unless the community in which such area is located is participating in the national flood insurance program. (Ritchie-Florida)
W74-06179

CONCURRENT RESOLUTION CONCERNING THE ADMINISTRATION OF THE FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1972.
House Concurrent Resolution 290, 93d Cong, 1st Sess (1973). 2 p.

Descriptors: *Legislation, *Government finance, *Federal Water Pollution Control Act(FWPCA), Water pollution, Water pollution control, Water pollution treatment, Treatment facilities, Construction, Costs, Legal aspects, Water supply, Environment, Environmental effects, Cost repayment, Water quality, Water quality control, Administrative agencies, Water demand, Potable water, Water purification.
Identifiers: Environmental Protection Agency(EPA).

The Administrator of the Environmental Protection Agency should not administer section 206 of the Federal Water Pollution Control Act (FWPCA) so as to establish any system of priorities which provides for the reimbursement of construction costs of water pollution control facilities built after June 30, 1966, prior to reimbursement of construction costs of such facilities built between June 30, 1956 and June 30, 1966. The resolution notes the deterioration in the condition of this nation's water systems, and the possibility of being without a decent water supply. Prior to the public awareness over the quality of the environment, a number of state and local governments acted with foresight to forestall disaster befalling the nation's water systems, and the FWPCA authorized reimbursement to those state and local governments which had the foresight to construct water pollution control facilities years ago. (Ritchie-Florida)
W74-06180

OPPEN V. AETNA INSURANCE CO. (ACTION FOR DAMAGES TO PLEASURE BOATS RESULTING FROM OIL SPILL DISASTER).
485 F.2d 252-260 (9th Cir. 1973).

Descriptors: *Judicial decisions, *Third party effects, *Environmental effects, *Harbors, *Federal-state water rights conflicts, *California, Federal jurisdiction, State jurisdiction, Legal aspects, Admiralty, Oily water, Boats, Water pollution, Water law, Civil law, Oil pollution, Navigation, Navigable waters, Pollutants, Pollution sources.

Owners of private pleasure boats sought to recover for physical damages to their boats caused

by an oil spill disaster, as well as damages for loss of navigation rights. On preliminary questions, the court held that a resolution on the choice of law issue with respect to whether admiralty jurisdiction and maritime law apply to a tort controversy must be based on the locale of the tort, the nature of defendants' activities, and also as to whether the wrong bears a significant relationship to traditional maritime activity. Plaintiffs were awarded compensation for the physical damages to their boats; however, damages were denied as to the second claim. The court reasoned both state and federal law applied. Under federal maritime law, the loss of the use of a private boat is not compensable. Further, for recovery under California law, as plaintiffs based their claims on a public nuisance theory, their damages had to have been different in kind from that suffered by the public generally. Since no special damages were shown, recovery was denied under state law. The court distinguished cases allowing damages from loss of navigation rights, stating in each of those, the chattel itself was unavailable for use because of the physical damage thereto or wrongful detention thereof and as their boats were usable, no damages were allowed. (Sutton-Florida)

WATER POWER.
N.Y. Environmental Conservation Law, secs. 15-1701 through 15-1751, p. 504-536 (1972).

Descriptors: *New York, *Legislation, *Water law, *Hydroelectric power, *Hydroelectric project, Permits, Regulation, Dams, Reservoirs, Canals, Water policy, Rivers, Streams, Watersheds, Legal aspects, Licensing, Impoundments, State governments, Administrative agencies, Structures, Impounded waters, Development, Water utilization, Water management, Riparian rights, Navigable waters, Land use, Planning.

Where any person takes, diverts, appropriates or otherwise uses the waters of the state of New York, over which the state has proprietary ownership of the flow and the use, such waters shall remain subject to the power and control of the state for purposes of regulation, licensing, controlling and termination of their use by such persons. The right to develop water power is contingent upon obtaining a license to do so from the Department of Environmental Conservation. Once permission is obtained, the licensee remains subject to the property rights of others, including riparian rights, when constructing, operating and maintaining across or along any such lands and waters dams, reservoirs, diverting canals, water conduits, power houses, transmission lines and other project works. Before issuing said licenses the Department shall determine that the exercise of such privileges will not impair or interfere with navigation upon such waters, and shall impose such conditions upon the licensee to protect and safeguard navigation. No license shall be vested unless and until signed and sealed by the governor. (Silber-Florida)
W74-06182

REGIONAL WATER PLANNING AND DEVELOPMENT.
N.Y. Environmental Conservation Law, secs. 15-1101 thru 15-1113 (1972).

Descriptors: *New York, *Legislation, *Water policy, *Water management(Applied), *Water resources, Project planning, Water law, Water resources development, Water supply, Water storage, Water utilization, Conservation, Regional development, Regions, Cities, Water demand, Water distribution, Water permits.

This title was enacted in order to stimulate and encourage local participation and assistance in the comprehensive planning for the protection, control, conservation, development and beneficial utilization of the water resources of New York. Any municipality may submit a petition requesting a survey and study of the water resources of a specified region of which the petitioning municipality is a part, for the purpose of preparing and providing a comprehensive plan for the protection, conservation, development and beneficial use of such resources. Upon receipt of a petition, the department shall hold public hearings for the purpose of hearing all persons, public corporations and state agencies in favor of or opposed to the proposals. If the department shall determine that the proposal should be undertaken, it shall appoint a regional planning board. Plans submitted after approval shall show the available and feasible sites for the installation of protective and regulatory works, and the benefits estimated to be derived from such installation. The plans shall also estimate the minimum annual amount of water available and shall provide for the storage of sufficient water for distribution. Any municipality may request that a plan be rescinded or modified. (Ritchie-Florida)
W74-06183

POWERS AND DUTIES OF DEPARTMENT OF FISH AND WILDLIFE.
N.Y. Environmental Conservation Law, secs. 11-0305 thru 11-0325 (1972).

Descriptors: *New York, *Legislation, *Fish, *Wildlife, Permits, Shellfish, Regulation, Legal aspects, Fish management, Fish conservation, Fish populations, Diseases, Waters, Water resources, Water resources development, Fish hatcheries, Water levels, Environmental effects, Droughts, Water supply, Water quality control, Water management, Water development.

Additional powers and duties are granted to the New York department of fish and wildlife. These include the power to regulate the taking of fish, increase the mesh of nets, regulate the transportation, importation and exportation of shellfish and management of all hatching and biological stations, game farms and game refuges owned or operated by the state. The department shall have power to close any waters of the state to the taking of fish whenever an environmental investigation reveals that fish life is in imminent danger of undue depletion because of low water levels brought on by drought. After consultation with the appropriate agencies of neighboring states, the department shall have power to fix open seasons, minimum size limits, manner of taking and seasonal limits for the taking of fish in the waters of New York. The department shall compile and index each year after the adjournment of the legislature the laws relating to fish and wildlife as amended. When it is determined by the appropriate state agencies that a disease which endangers fish, wildlife, livestock or humans exists in any area of the state, the department shall have authority to suspend or prohibit all hunting, trapping or fishing in and adjacent to the infected area. (Ritchie-Florida)
W74-06184

RESTRICTIONS ON STRUCTURES BUILT OVER STATE WATERS.
N. H. Rev. Stat. Ann., ch. 488-B:1 to 488-B:2 (Supp. 1972).

Descriptors: *New Hampshire, *Water resources development, *Structures, *Structural design, *Legislation, *Water conservation, Water resources, Legal aspects, Penalties(Legal), Shores, Regulation, Land use, Riparian land.

No new construction or modification of an existing structure intended for use as a dwelling shall be permitted if any part extends beyond the shoreline of any public or publicly owned body of water. In this regard, 'shoreline' shall be that shoreline which exists when the surface of the water is at the mean high water level. Any person who violates the statute shall be fined not more than one thousand dollars and shall be required to remove the structure or portion thereof in violation of the statute. Such fine shall accrue to the use of the town or city in which the structure is located. (Sutton-Florida)
W74-06185

LAND AND WATER CONSERVATION AND RECLAMATION.
Pa. Stat. Ann., secs. 5101-5121, p. 52-63 (1967).

Descriptors: *Pennsylvania, *Legislation, *Water law, *Conservation, *Land reclamation, Planning, Land development, Water quality, Water pollution control, Water pollution sources, Waste disposal, Waste treatment, Mine wastes, Mine drainage, Mine water, State governments, Administrative agencies, Water resources development, Streams, Waste water disposal, Waste water treatment, Cities, Water management.

The Land and Water Conservation and Reclamation Act encompasses the prevention, control and elimination of stream pollution from mine drainage, the prevention, control and elimination of air pollution from burning coal refuse banks, and the restoration of abandoned mines, as well as the construction, reconstruction and improvement of sewage treatment plants and facilities, to accelerate the restoration and protect the quality of the state's waters. Plans for abatement of stream pollution by constructing and operating interceptor plants and other facilities appurtenant to polluters and dischargers are also outlined. Reclamation of used and abused lands as well as creation and establishment of recreation facilities and park space is provided for. The Act provides for state financial subsidies to the various municipalities and subdivisions that participate in the amount of one hundred million dollars. (Silber-Florida)
W74-06186

OIL TERMINAL FACILITIES.
N.C. Gen. Stat., secs 143-215.95 thru 143-215.99 (1973).

Descriptors: *Oil pollution, *Legislation, *Enforcement, *North Carolina, Water law, Oil wastes, Air pollution standards, Water pollution standards, Wildlife pollution standards, Research, Education, Natural resources, Water resources development, Data acquisition, Data processing, Pollution control, Regulation, Water policy, Environmental engineering, Navigation, Structures.
Identifiers: *Oil terminal facilities, *Oil refining, *Secretary of Natural and Economic Resources.

The North Carolina Secretary of Natural and Economic Resources shall administer the provisions for oil terminal facility registration and engage in research concerning oil terminal facilities. Mandatory registration need be obtained with respect to all terminal facilities by furnishing the requisite information to the office of the Secretary of Natural and Economic Resources. Further legislation concerning oil pollution shall be recommended, and all rules and regulations necessary for the implementation of legislation may be adopted. Penalties exist for violations of any rule or regulation. Also included is a provision providing for the construction of facilities for oil refining based upon air, water, and wildlife pollution standards. (Proctor-Florida)
W74-06187

HELMS V. DIAMOND (APPEAL FROM AGENCY ORDER PROHIBITING LANDING OF SEAPLANES ON BODIES OF WATER WITHIN FOREST PRESERVE).
349 N.Y.S. 2d. 917 (Sup. Ct. 1973).

Descriptors: *New York, *Judicial decisions, *Legal aspects, *Water law, *Water rights, Prescriptive rights, Ground water, Competing

uses, State governments, Administrative agencies, Water utilization, Water resources, Water management, Water resources development, Natural resources, Surface waters, Water policy, Regulations, Standards, Adverse possession.
Identifiers: Injunctive relief.

This is an action in the State of New York by petitioner, engaged in the seaplane business, seeking a judgement nullifying and enjoining an order by respondent, Commissioner of Environmental Conservation prohibiting the landing of seaplanes on bodies of water wholly bounded by State land within the Adirondack Park. The Supreme Court of Schenectady County held that the petitioner failed to establish that the order was beyond the power of the Commissioner or that it was arbitrary and capricious and therefore a preliminary injunction would be denied. The Court noted that injunctions are sparingly issued and a clear legal right thereto plus a showing of irreparable injury must be present before such relief may be granted. Furthermore, the Court rejected petitioner's claim of adverse possession and stated that it is impossible for individuals to acquire vested rights in a state forest preserve by means of adverse possession, long use or prescriptive right. (Silber-Florida)
W74-06188

FLOODWAY REGULATIONS.
N.C. Gen. Stat., secs. 143-215.56 (1971).

Descriptors: *North Carolina, *Permits, *Flood plain zoning, *Floodplains, *Flood protection, Floodproofing, Flood damage, Public health, Regulation, State governments, Floodways, Zoning, Building codes, Water zoning, Legislation, Adoption of practices, Local governments, Administration, Coordination, Public safety, Legal aspects, Decision making.
Identifiers: *Administrative regulations.

This statute regulates artificial obstructions in floodways. The channel and a portion of the floodplain of all the state's streams will be designated as a floodway and artificial obstructions may not be placed there except in accordance with the statute. The purpose of this designation is to help control and minimize the extent of flood damage in flood hazard areas. The statute delineates uses which may be made of floodways as a matter or right, and provides that local governments can issue permits for the use of floodways if they are consistent with the purposes of the statute. The Board of Water and Air Resources and local governments may designate a floodway by showing it on a map or drawing, or by written description. If the Board determines an area to be a floodway and the local governments within which the stream lies have not delineated it as such, they will still bear the responsibility to control the uses in that area. Prior public notice and notice to local governments will be given to apprise all interested persons of the nature of the regulations, the effective date, and the stream affected thereby. (Sperling-Florida)
W74-06189

WELL CONSTRUCTION ACT.
N.C. Gen. Stat., secs. 87-83 through 87-96 (1967).

Descriptors: *North Carolina, *Adoption of practices, *Regulation, *Water conservation, *Water sources, Water table, Subsurface water, Watershed management, Well casings, Permits, Artesian wells, Legislation, Pumps, Confined water, Engineering structures, Water bearing formations, Artesian wells, State governments, Administration, Water pollution sources, Public health.
Identifiers: *Administrative regulations.

Improperly constructed, operated, maintained, or abandoned wells can adversely affect the public health and the ground water resources. This statute provides for the adoption of rules governing the location, construction, repair, and abandonment of wells, and the installation and repair of pumps and pumping equipment. Any proposed rules must go before public hearings. Prior permission must be obtained for the construction of any water well or well system with a designed capacity of one hundred thousand gallons or more. Anyone who completes or abandons any well is to furnish a certified record of the construction or abandonment within thirty days. Each well is to be maintained and constructed so as not to be a source or channel of contamination of the groundwater supply or any aquifer. Valves and casings are to be maintained on flowing artesian wells so the flow of water can be stopped. Each well is also required to have an access port to determine the water level. Whenever mineralized or polluted water zones are present they must be adequately cased or cemented. Water for domestic consumption will be sterilized. Rights of investigation, entry, access and inspection exist to insure compliance with the regulations. Provisions are also made to give notice of alleged violations and a hearing whose final order is subject to judicial review. (Sperling-Florida)
W74-06190

SOLID WASTE DISPOSAL.
N C Gen Stat, secs. 130-166.16 thru 130-166.33 (1969).

Descriptors: *Solid waste disposal, *Sewage treatment, *Groundwater, Pollution, *North Carolina, *Water quality control, Water law, Administrative agencies, State legislation, Public health, Public safety, Landfills, Ultimate disposal, Water pollution sources, Waste dumps, Water quality, Sewage, Sewage disposal, permits.

The North Carolina Department of Human Resources will maintain administrative units to promote sanitary disposal of solid waste in accordance with the promotion of the preservation of the environment. The Department is authorized to engage in research to implement a statewide solid waste disposal program. State standards of solid waste disposal shall be formulated and applied. The Department may accept loans and grants in order to aid research and implementation. Provisions for the recordation of the Department's order of approval for sanitary landfills are set forth. The Ground Absorption Sewage Disposal System Act of 1973, a portion of this act, manifests the effort to combat the detrimental effect of the contamination of ground water supply created by the faulty installation of ground absorption sewage disposal systems. Local health departments shall issue improvement authorizations for installation work. Upon satisfactory completion, certificates of completion shall issue. A limitation upon electrical service is established until inspection is completed. Procedures for appeals to the local board of health upon denial of permits and judicial review are provided. (Proctor-Florida)
W74-06191

DEPARTMENT OF SEA AND SHORE FISHERIES: COMMISSIONER.
6 Me Rev Stat Ann, tit. 12, secs 3451, 3452, 2501-3505 (Supp 1972-1973).

Descriptors: *Maine, *Marine fisheries, *Estuarine fisheries, *Legislation, *Conservation, Coastal waters, Shellfish, Estuarine environment, Environment, Fish management, Fisheries.

The Department of Sea and Shore Fisheries is renamed the Department of Marine Resources. The department is established to conserve and develop marine and estuarine resources and to conduct and sponsor research; to promote and develop the Maine coastal fisheries industry; to advise agencies of state and local government and agencies of the Federal Government concerned with development or activity in coastal waters; to implement, administer and enforce the laws and regulations enacted under the direction of a Commissioner of Marine Resources. The commissioner may authorize the taking of polluted shellfish for the purpose of depurating them. The powers and duties of the commissioner include making a biennial report, holding property, accepting funds and entering into reciprocal agreements. Other subjects within the realm of the activities of the commissioner include conservation and development of marine resources, conservation of certain marine species, and procedure for adoption of regulations. (Sears-Florida)
W74-06192

RESEARCH AND DEVELOPMENT.
6 Me Rev Stat Ann, Tit. 12, secs 3701-3708 (Supp 72-73).

Descriptors: *Maine, *Research and development, Cultivation, Conservation, Coasts, Marshes, Wetlands, Shores, Legislation.
Identifiers: *Coastal waters, *Coastal zone management.

This statute covers acquisition of flats and waters, experimentation and cultivation in areas closed because of contamination, research by private interests, special licenses, interference or unlawful taking, marine resources research and the authorization of the Commissioners of Sea and Shore Fisheries and Inland Fisheries and Game to manage and lease certain alewife fishing rights. Any coastal waters or any coastal flats may be set apart for scientific research or experimental cultivation of marine species. Experimentation on shellfish and other marine species on shores, waters and flats closed because of contamination is authorized. Any private party interested in research in shellfish or development of the shellfish industry or seaweeds must make application to do so. A special license can be granted exempting the holder from certain laws relating to the taking of fish or shellfish. It is unlawful for any person to destroy any marine species or interfere with the shores in any area set apart as above stated. (Sears-Florida)
W74-06193

PROTECTION AND IMPROVEMENT OF WATERS: GREAT PONDS PROGRAM.
16 Me Rev Stat Ann, tit 38, secs 380-285 (Supp 1973).

Descriptors: *Maine, *Ponds, *Legal aspects, *Legislation, Eutrophication, Bodies of water, Aquatic habitats, Surface waters, Standing waters, *Water pollution control.

Great ponds are valuable. Uses are causing rapid acceleration of the eutrophication of great ponds. There are a number of entities within the state of Maine administering programs related to great ponds, these programs need coordination. Existing water related environmental statutes were basically developed for free-flowing bodies of waters and are not adequate for application in protecting great ponds. It is the intention of the legislature that existing programs related to great ponds continue in their present form and that the Department of Environmental Protection develop new programs. A great pond is any inland body of water which in its natural state has a surface area in excess of 10 acres, and any inland body of water artifically formed or increased which has a surface area in excess of 30 acres, the shore of which is owned by 2 or more persons. The board shall establish criteria for classifying great ponds and guidelines for waste control systems, maintain a data bank and conduct research. (Sears-Florida)
W74-06194

NATURAL RESOURCES--COAL REFUSE DISPOSAL CONTROL ACT.
W Va Code Ann, secs 20-6C-1 through 20-6C-8 (1972).

Descriptors: *West Virginia, *Legislation, *Water utilization, *Water sheds, *Land management, Water policy, Watershed protection, Flood control, Impoundment, Impounded waters, Industrial use, coal mine wastes, Industrial wastes, Strip mine wastes, Water control, Coals, Waste disposal.
Identifiers: Coal refuse disposal piles, Injunctive relief.

West Virginia statute known as the Coal Refuse Disposal Control Act recognizes that in certain areas disposition of materials displaced in the mining of coal creates coal refuse disposal piles which have in the past and may in the future endanger the lives and properties of persons residing in the hallows and valleys of the affected watersheds. These piles may also threaten streams, roads, schools and other public properties and facilities, and result in the creation of emergency situations. The act authorizes the director of the department of natural resources to inspect all coal refuse disposal piles and associated water impoundments and make competent engineering evaluations and opinions concerning their adequacy and stability. Within a year the director shall make findings concerning the stability and safety of coal refuse disposal piles which may cause water impoundments or otherwise pose a hazard to human life. Whenever the director determines that a coal refuse disposal pile poses an imminent threat to human life he may enter the land involved without the landowner's permission and take whatever remedial action may be necessary or expedient to abate the dangerous conditions. (Silber-Florida)
W74-06195

PENDING WATERSHED PROJECTS.
Hearings--Before the Subcommittee On Water Resources, Committee On Public Works, U S Senate, 93r Cong, 1st Sess, October 4, 1973. 17 p, 2 tab.

Descriptors: *Watersheds(Basins), *Watershed management, Governments, Floods, Flood control, Water, Water resources, Water utilization, Land, Land use, Land development, Structures, Levees, Irrigation, Drainage, Recreation, Fish, Wildlife, Water supply, Water management, Erosion, Kentucky, Texas, New Mexico, Pennsylvania, Illinois.

The Watershed Protection and Flood Prevention Act authorizes the Secretary of Agriculture to cooperate with local organizations having authority to carry out, maintain, and operate works of improvement for flood prevention or for the conservation, development, utilization and disposal of water and related land resources in watershed areas. The Act provides for a project-type approach to soil and water resource development, use, and conservation. Significant watershed problems include those requiring implementation of projects such as floodwater retarding structures, levees, floodways, irrigation, and drainage improvements; recreation or fish and wildlife development; municipal or industrial water supply systems; and other water management measures. An integral and extremely important part of watershed projects is the system of land treatment measures such as contouring, terracing, grass waterways and vegetative practices, to reduce erosion of upland areas and provide for conservation of all resources in the project area. Watershed work plans for the Banklick Creek Watershed, Kentucky, the Cornudas, North and Culp Draws Watershed, Texas and New Mexico, the Hitson, C and L, and Washburn Draws Watershed, Texas, the Nescopeck Creek Watershed, Pennsylvania, and the Upper Salt Creek Watershed, Illinois were considered. (Ritchie-Florida)
W74-06196

DISCHARGE OF SEWAGE INTO WATERS.
N Y Sees Laws, Ch 664, secs 17-1701 through 17-1741 (McKinney 1973).

Descriptors: *New York, *Sewage, *Water quality control, *Water pollution, *Impaired water quality, Industrial wastes, Liquid wastes, Solid wastes, Waste water(Pollution), Water pollution sources, Legislation, Governmental interrelations, State governments, Effluents, Permits, Water law.

No person, corporation or municipality shall place, or cause to be placed, or discharged into any of the waters of New York, in quantities injurious to the public health, any of the following: sewage, garbage, offal, any decomposable or putrescible matter of any kind, effluent from any sewage disposal plant, any substance, chemical or otherwise, any refuse or waste matter, either solid or liquid, from any sewer or drainage system or from any shop, factory, mill or industrial establishment; unless permission to do so shall have first been given in writing as provided in this article. It shall be unlawful for any person to introduce into any spring, brook or body of water used in the manufacture of salt, any impure or deleterious substance or thing whatsoever. Whenever the commissioner shall determine that sewage of any kind is being discharged into any of the waters of this state, and when in the opinion of the commissioner such discharge is polluting such waters in a matter injurious to health, he may order the municipality, corporation or person to show cause why such discharge should not be discontinued. After a hearing, the commissioner may issue an order directing that the discharge be discontinued. (McKnight-Florida)
W74-06199

RIVER IMPROVEMENT.
N Y Sess Laws, Ch 664, secs 15-2301 through 15-2321 (McKinney 1973).

Descriptors: *Channel flow, *River regulation, *Flood control, *Channel improvement, *Dikes, Legislation, Governmental interrelations, *New York, Navigable rivers, Public health, Regulation, Water management(Applied), Construction.
Identifiers: Administrative regulations.

Projects may be undertaken to improve channels, construct dikes or regulate river flow for the protection of life, property and the public health or welfare from damage by floods, to be done at the expense of both the owners of the properties and of the political subdivisions of New York benefited thereby. Bodies corporate known as river improvement districts may be created to carry out the purposes of this statute. Any county, city, town, or village, or any persons owning land bordering on or near any watercourse may petition for the formation of a district. After receipt of such a petition, the state shall investigate, conduct a public hearing, and then determine whether the public health, safety, or welfare require the formation of the district and make a final order with regard thereto. Within each district there shall be a River Improvement Association, the object of such association shall be to represent the interests of the district to the state. (McKnight-Florida)
W74-06200

KRESHTOOL V. DELMARVA POWER AND LIGHT CO. (PERMIT TO CONSTRUCT ELECTRIC GENERATING UNIT IN COASTAL ZONE)
310 A 2d 649 (Del Super 1973).

Descriptors: *Delaware, *Electric powerplants, *Permits, State governments, Administrative agencies, Industrial production, Regulation, Economic impact, Electric power industry, Water pollution, Community development, Water pollution effects, Psychological aspects, Administrative agency, Environmental effects, Judicial decisions, Legal aspects, Water law, Water pollution control, Coasts.
Identifiers: *Coastal Zone Act, *Environmental impact, Administrative regulations, Coastal Zone management, Administrative discretion.

This is an appeal from a final order of the State Coastal Zone Industrial Board which granted Delmarva Power and Light Company a permit to construct an electric generating unit. The new unit was to be located at a site where Delmarva presently operates four similar units. The appellants opposed Delmarva's application at the hearing, held by the Board which reviewed the state planner's decision. The Board affirmed the permit and an appeal was taken to the Supreme Court of Delaware. The Coastal Zone Act prohibits the construction of new heavy industry within the coastal zone. The purpose of the statute is to control the type of industrial development that is most likely to cause water pollution. To this end, the statute creates a permit issuing procedure and enumerates factors to be taken into consideration which include the environmental impact and aesthetic effects. The court held that the Board consider all the relevant factors set out in the statute, and that the court could not supplant the sound judgement of the Board with its own. (Sperling-Florida)
W74-06201

WATER SUPPLY RESERVOIRS--RECREATIONAL ACTIVITIES.
Pub Acts of Conn, act 73-522, secs 1,2,3,4. (1973)

Descriptors: *Connecticut, *Boating, *Sport fishing, *Water pollution sources, *Reservoir operation, Camping, Beaches, Public health, Recreation, Recreation wastes, Recreation facilities, Swimming, Treatment facilities, Reservoir management, Public health, Impounded waters, Water treatment, Water quality, Water quality control.

This act concerns recreational activities on the grounds of public water supply reservoirs. Sport fishing from definite shoreline locations and from oar propelled boats may be permitted by a water company. This permission will not issue until the commissioner of health and the department of environmental protection is consulted and it is found that treatment facilities are able to safeguard the health of persons drinking the water. The act also provides that all reservoirs constructed after 1974 must have such treatment facilities as will assure purity of the water supplies which such recreation is permitted. Water companies are empowered to issue permits and charge fees in order to reimburse the companies for the cost to them of such fishing and recreational activities. The act exempts water companies from liability, except for willful or wanton conduct, for injury or damage to any person entering its land under the provisions of this act. (Sperling-Florida)
W74-06202

SAVE OUR BAY, INC. V. HILLSBOROUGH COUNTY POLLUTION CONTROL COMMISSION (ACTION SEEKING TO PREVENT WATER POLLUTION).
285 So 2d 447-449 (Fla D C A 1973).

Descriptors: *Water pollution, *Abatement, *Judicial decisions, *Water quality control, Sewage treatment, *Florida, Water pollution effects, Aesthetics, Recreation, Water pollution sources, Water law, Water quality standards, Water treatment, Pollution abatement, Public safety, Public welfare, Recreation.
Identifiers: *Injunctive relief.

Appellants, members of a nonprofit corporation using the waters in controversy for bathing and recreation, appeal from the order of the trial court dismissing the amended complaint on the basis of appellants' lack of standing to sue. The court on appeal examined the question of whether the amended complaint states a cause of action. The appellants alleged in their complaint that they have for many years used the waters of Old Tampa Bay and its tributaries for bathing and recreation, and that the defendant utility companies have been continuously polluting in violation of Florida laws

and regulations by the discharge of improperly treated effluent into streams and tributaries. As a result, the Hillsborough County Pollution Control Commission (HCPCC) issued a pollution citation against the defendants who subsequently failed to upgrade their sewer plants or change pollution conditions. Appellants alleged that the HCPCC should have taken abatement action within thirty days of the receipt of the complaint. The District Court of Appeals ruled that the appellants possessed standing to sue and were not required to demonstrate injury beyond that sustained by the general public. The complaint was also held to be sufficient, and the lower court's decision was reversed. (Proctor-Florida)
W74-06203

CONSERVATION OF MARINE RESOURCES.
R I Gen Laws Ann, secs 46-17.1-1, 46-17.1-2 (Supp 1972).

Descriptors: *Rhode Island, *Legislation, *Water law, *Waste disposal, *Conservation, Fisheries, Water quality, Sewerage disposal, Natural resources, Aquatic life, Water management(Applied), Water utilization, Water rights, Legal aspects, Water quality control, Permits, Water pollution, Water pollution control, Navigation.

No person shall, without state permission, transport or cause to be transported, dump or cause to be dumped within the territorial waters of the state of Rhode Island, any waste or dredge material dredged from any harbor or channel or removed from any dump or sewerage treatment plant. These prohibited materials include mud, silt, shale, rock, muck, sand, garbage or sewerage. The director of the department of natural resources may issue permits for the transporting and disposal of dredge or waste materials within the territorial waters of the state. Issuance of the permit is conditioned upon written application, public hearing and an investigation by the director that such movement and disposal of materials as set forth in the application would not be in conflict with marine ecology, and that existing fishing grounds would not be damaged or destroyed. Upon issuance of a permit, a qualified state inspector, appointed by the director, must be on board the tow vessel for all transporting and dumping operations to assure compliance with the terms contained in the permit. (Silber-Florida)
W74-06204

RHODE ISLAND WATER RESOURCES BOARD.
R I Gen Laws Ann, secs 46-15-6, 46-15-13 (Supp 1972).

Descriptors: *Rhode Island, *Legislation, *Water resources, *Wells, *Drilling, Well regulations, Administrative agencies, Regulation, Planning, Resources, Subsurface waters, Subsurface investigations, Underground, Conservation, Administration.

The water resources board is authorized and empowered to require that no person, firm or corporation shall engage in the business of digging, drilling or constructing wells within the state unless said person, firm or corporation first registers with the board. The board, upon giving due notice of intent and purpose, without being liable for trespass, shall have the right and is authorized to enter in, over and onto any lands or waters in the state and bring any equipment and devices as may be necessary and appurtenant for the conducting of examinations, investigations, appraisals, surveys or other studies and for the making of test pits, pumping tests, borings, and other forms of geologic investigations. (Silber-Florida)
W74-06205

CONTAMINATION OF DRINKING WATER.
R I Gen Laws Ann, secs 46-14-1, 46-14-2, 46-14-4, 46-14-5 (Supp 1972).

Descriptors: *Rhode Island, *Legislation, *Water law, *Pollution control, *Water resources, Administrative agencies, Reservoirs, Lakes, Streams, Wells, Water supply, Water utilization, Water demand, Pollution abatement, Sewage disposal, Drainage, Water quality, Water quality control, Rivers.

No person shall throw or discharge into any well, spring brook, lake, pond, reservoir or stream used as a source of water supply for drinking purposes by any city, town, district, institution or company, or into any known tributary or feeder of any such water source, any sewage, drainage, refuse or other noxious matter or thing tending to pollute or corrupt or impair the purity of such waters, or render the same injurious to health. Nor shall any person bathe, swim, or wash any animal, clothing or any other article in any of the above mentioned waters. The bathing prohibition shall not apply to licensed camps or bathing resorts. The director of health when satisfied that any sewage, drainage or refuse or polluting matters exists in a locality such that there is danger that the condition may pollute or corrupt or impair the purity or quality of any of the above mentioned waters or render them injurious to health, may order the owner or occupier to desist from such practices. (Silber-Florida)
W74-06206

PROHIBITION OF WATER POLLUTION.
R I Gen Laws Ann, secs 46-12-4, 46-12-5, 46-12-14 (Supp 1972).

Descriptors: *Rhode Island, *Water law, *Legislation, *Water quality control, *Pollution, Pollution control, Pollution abatement, Sewage disposal, Waste water treatment, Waste water disposal, Sewage discharge, Administrative agencies, Water conservation, Water management, Water control, Water policy, Water pollution sources, Water pollution treatment.

It shall be unlawful for any person to cause pollution of any waters of the state Rhode Island or to cause sewage to be placed where it is likely to cause pollution, or to place any solid waste materials, junk or organic or non-organic debris of any kind in any stream, river, brook, pond or lake. The director of water resources upon approval of the system or means used, may permit treated sewage to be discharged into the state's waters. The director must also approve the construction and installation of any system or means to prevent pollution. It shall also be unlawful to construct or install any industrial, commercial or other establishment which may result in the discharge of any sewage into the state's waters unless approved by the director. The director shall investigate any situation he believes is in violation of this statute. (Silber-Florida)
W74-06207

A BILL TO AMEND TITLE II OF THE WATER POLLUTION CONTROL ACT AMENDMENTS OF 1972 (PUBLIC LAW 92-500).
Senate Bill 2531, 93d Cong, 1st Sess (1973). 3 p.

Descriptors: *Federal Water Pollution Control Act, *Legislation, *Government finance, *Water pollution treatment, Water pollution, Construction, Treatment facilities, Water pollution control, Abatement, Sewage, Industrial wastes, Water storage, Water reuse, Sewers, Storm runoff.

This bill amends section 206 of the Water Pollution Control Act Amendments of 1972 (FWPCA) by adding new provisions. The bill provides that any project initiated after January 1, 1973, which did not receive federal grant support, shall be eligible for future reimbursement. Such projects, however, must be approved by the appropriate state water pollution control agency and by the Administration as meeting all applicable requirements of the FWPCA. An amendment has been proposed to the above bill, to provide for reimbursement for projects initiated after July 1, 1972. Section 212 of the FWPCA is also amended to redefine the term 'treatment works' by providing that the foundations and excavations related to those treatment works are included within the definition of that term. (Ritchie-Florida)
W74-06208

DRAINS AND DITCHES.
Tenn Code Ann, secs 70-501 through 70-506 (1932).

Descriptors: *Tennessee, *Legislation, *Land reclamation, *Drainage, *Swamps, Wet lands, Land development, Surface drainage, Drainage practices, Ditches, Surface waters, Watersheds, Marshes, Standing waters, Stagnant waters, Land tenure, Land use, Legal aspects, Land resources.

Swamp land drainage is a public improvement, conducive to the health of the inhabitants and wealth of the state of Tennessee. Whenever such lands, owned by one person, are surrounded by lands of others who refuse the privilege of cutting drains through their lands, and such drains are necessary to the reclaiming of the wet lands, the owner of the wet lands may apply to the county court by petition, upon five days notice to the adjoining proprietors, for a jury of veiw to mark out the line of drains across such adjoining lands, and to assess the damages done thereby. Upon the return of the jury, setting forth a plan of the grounds and the proposed drains, and assessing the damages, the court may make an order authorizing the petitioner to dig such ditches and keep them in repair, upon paying the damages assessed, together with all costs. No ditch shall run between the dwelling house and any outhouse, garden or orchard or within 100 yards of the dwelling house, without the consent of the owner of the land through which the ditch is to pass. (Silber-Florida)
W74-06209

WATER ENVIRONMENTAL HEALTH ACT.
Tenn Code Ann, secs 53-2029 through 53-2041 (1971).

Descriptors: *Legislation, *Water law, *Tennessee, *Water treatment, *Wastewater treatment, Water quality, Water quality control, Water supply, Water management Water conservation, Water pollution, Water pollution control, Waste water disposal, Waste treatment, Waste disposal, Water distribution, Sewage treatment.

It shall be unlawful for any person, firm, or corporation, either municipal or private, operating a water supply system or wastewater system, to operate the water treatment plant, wastewater treatment plant, or water distribution system unless the competency of the operator who is in direct responsible charge is duly certified by the commissioner of public health. A board of certification is established to advise and assist the commissioner in the administration of the certification program. The commissioner shall also classify all water treatment plants, wastewater treatment plants, water distribution systems and wastewater collection systems with due regard to their size, type, physical conditions affecting them and their distribution systems, and according to the skill, knowledge and experience that the operator must have to successfully supervise the operation of the plant or system so as to protect the public health. SOLID WASTE DISPOSAL.
Tenn. Code Ann., secs. 53-4301 through 53-4312 (1969).

Descriptors: *Tennessee, *Legislation, *Solid wastes, *Ultimate disposal, *Environmental sanitation, Waste disposal, Sewage disposal, Water quality, Water quality control, Land utilization, Land management, Water policy, Water pollution control, Water pollution abatement, Government, Waste treatment, Public rights, Legal aspects.
Identifiers: *Nuisance(Legal aspects).

The Tennessee Solid Waste Disposal Act was enacted to protect the public health, safety and welfare; prevent the spread of disease; conserve natural resources; and enhance the quality of the environment. It declares that depositing solid waste into the waters in a manner not approved by the stream pollution control board, the burning of solid wastes in an unapproved manner or the construction, alteration or operation of a solid waste processing or disposal facility in violation of regulations shall constitute a public nuisance. All solid waste processing or disposal facilities within the state must be registered with the commissioner. The department shall establish regulations for the operation and supervision of such solid waste processing and disposal facilities. This act shall not prohibit any person from disposing of his own solid wastes upon his own land provided such disposal does not create a public nuisance or a hazard to the public health. (Silber-Florida)
W74-06211

GAGE V. COMMONWEALTH EDISON CO. (SUIT AGAINST AEC AND AN ELECTRIC COMPANY FOR ALLEGED DEPRIVATION OF RIGHTS UNDER NEPA).
356 F. Supp. 80-88 (N.D. Ill., E.D. 1972).

Descriptors: *Judicial decisions, *Legal aspects, *Riparian rights, *Federal government, *Legislation, Environmental effects, Power plants, Administrative agencies, Administrative decisions, Water policy, Water law, Water utilization, Water demand, Environment, Land development, Regulations, Standards, Control, Management, Nuclear powerplants.
Identifiers: National Environmental Policy Act(NEPA).

A proceeding in the United States District Court was brought against the Atomic Energy Commission (AEC) and its members and an electric company for alleged deprivation of rights under the National Environmental Policy Act (NEPA). On motions of the AEC and the electric company to dismiss for lack of jurisdiction and for failure to state a claim upon which relief could be granted, the court held that the AEC's failure to perform an alleged duty imposed by the NEPA did not constitute a 'final agency order' within the section providing for appellate review of the validity of the AEC's order. The court also held that the AEC's failure to prepare an environmental analysis prior to the electric company's acquisition of land for a nuclear power plant was 'agency action,' but was not final in nature. Prior to the application for a construction license, there was no clear legal duty for the Commission to act. The motions were granted and the cause was dismissed without prejudice. (Silber-Florida)
W74-06212

A BILL TO DECLARE A NATIONAL POLICY THAT THE BEACHES OF THE UNITED STATES ARE IMPRESSED WITH A NATIONAL INTEREST AND THAT THE PUBLIC SHALL HAVE FREE AND UNRESTRICTED RIGHT TO USE THEM.
Senate Bill 2621, 93d Cong, 1st Sess (1973). 8 p.

Descriptors: *Legislation, *Beaches, *Public rights, *Legal aspects, Government financing, Access routes, Recreation, Recreational facilities, Transportation, Easements, Public access, Riparian land, Prescriptive rights, Boundaries(Property), Federal government, Government finance.
Identifiers: Injunctive relief.

The National Open Beaches Act states as its policy that the beaches of the United States are impressed with a national interest and that the public shall have free and unrestricted right to use them, consistent with the constitutionally protected property rights of littoral landowners. The bill would prohibit the construction or maintenance of any barrier which interferes with the public's right to use the public beaches. The Secretary of Transportation is authorized to provide financial assistance to any state for the development of transportation facilities necessary for the use of public beaches. An action shall be cognizable in the district courts, at the instance of the Attorney General or a United States district attorney to establish and protect the public right to beaches, determine the existing status of title, and condemn such easements as are necessary to accomplish the purposes of this Act. Such actions may be for injunctive, declaratory or other suitable relief. A showing that the area is a beach shall be prima facie evidence that there exists a prescriptive right to use it as a common. States may obtain financial assistance for the acquisition of interests in land designed to secure the right of the public to beaches. (Ritchie-Florida)
W74-06213

A BILL TO AMEND THE FISH AND WILDLIFE COORDINATION ACT TO PROVIDE FOR THE PRESERVATION OF NATURAL GAME FISH STREAMS.
House Bill 3830, 93d Cong, 1st Sess (1973). 5 p.

Descriptors: *Streams, *Pollutants, *Fisheries, *Legislation, Fish management, Water pollution treatment, Federal agencies, State agencies, Legal aspects, Stream improvement, Environmental protection, Stream stabilization, Streambeds, Beds, Water law, Financing, Recreation, Fish, Fish populations, State governments.

The Natural Game Fish Stream Preservation Act of 1972 proposes an amendment to the Fish and Wildlife Coordination Act. In the national interest of preserving the endangered natural game fish streams and their native fish populations, federal assistance must be provided. The amendment provides necessary definitions of terms used in the section. State agencies responsible for the management of game fish shall apply to the Secretary of the Interior for assistance. If the determination is made that the preservation of the stream in question is consistent with the amendment, funds may be granted. A grant is contingent upon the state's showing that the taking of fish and the maintenance of the stream and its immediate environs will be regulated. Any state receiving assistance under this act shall appoint a citizens' advisory committee, which shall file an annual report with the Secretary of the Interior with respect to the rules, supervisory practices and use of all natural game fish streams for which assistance has been provided. (Proctor-Florida)
W74-06214

A BILL TO PROVIDE FOR THE CONSERVATION AND MANAGEMENT OF FISHERIES AND FOR OTHER PURPOSES.
House Bill 4756, 93rd Cong, 1st sess. (1973).

Descriptors: *Fish, *Fish management, *Fish conservation, *Federal government, *Fisheries, Legislation, Commercial fishing, Ecology, Administration, Inter-agency cooperation, Government finance, Water resources development, Nonstructural alternatives, Federal jurisdiction, Federal-state water rights conflicts.
Identifiers: *Enforcement.

The fishing management and conservation zone which the act will encompass is that zone contiguous to the territorial sea of the U.S., and the act will be administered by the Secretary of Commerce. The Secretary will have the power to promulgate zone regulations as to where and when no fishing will be permitted, size and catch limits regarding fish species, prohibition of certain types of fishing gear, and any others deemed necessary. The act sets forth the rules under which these regulations may be promulgated. State regulations can be adopted as federal regulations by the Secretary if they will achieve the act's objectives, taking into account uniformity with other regulations. Provisions are made for cooperation with the Secretary of State and other agencies concerning negotiations with contracting parties in regard to further measures for the conservation of living resources of the high seas. Prohibitions and penalties are set forth including fine limitations for different offenses. Enforcement within the fisheries zones will be by the Secretary, and the Coast Guard, with the federal district courts having exclusive jurisdiction concerning such matters. State jurisdiction shall not be restricted and appropriations shall be made available. (Sutton-Florida)
W74-06215

DRAINAGE, FLOOD AND POLLUTION CONTROL.
Ill. Ann. Stat., Ch. 42, sec. 472 (Smith-Hurd Supp 1973).

Descriptors: *Illinois, *Legislation, *Drainage, *Watershed management, *Flood control, Drainage systems, Hydrography, Water control, Flood protection, Hydrology, Controlled drainage.

The Department of Transportation is directed to make a survey and prepare a master plan for the drainage and flood control of all watershed areas of the State of Illinois and for lessening or avoiding hazards to persons and damage to property from flood waters. The plan shall set out the hydrography of each watershed area including rainfall and runoff, frequency and severity of floods, estimates of flood heights for purposes of planning and regulation of development within and along flood water channels, frequency and degree of low flows and drainage of upland and bottom land and urban areas. Whenever a plan for the drainage and flood control of any particular watershed area has been prepared it shall be made available to private interests and public agencies having drainage powers in the development of drainage projects. (Sears-Florida)
W74-06216

A BILL TO AUTHORIZE THE ESTABLISHMENT OF THE FLORIDA FRONTIER HISTORIC RIVERWAY, AND FOR OTHER PURPOSES.
House Bill 1719, 93d Cong, 1st sess (1973).

Descriptors: *Federal project policy, *Administration, *Legislation, Estuaries, *Estuarine environment, Federal government, *Florida, Financing, Project planning, Water resources development, Project purposes, River basin development, Planning, Area redevelopment, Surface waters, Water resources.
Identifiers: *Nassau River estuary(Fla).

The Nassau River estuary has a setting and natural environment that is virtually unimpaired and possesses important scenic, ecological and scientific values. It would be in the national interest to preserve this estuary and associated historic sites and buildings. Appropriate funds are authorized to carry out this project and administration will be under the auspices of the Secretary of the Interior. The Secretary is authorized to acquire by donation, purchase or exchange not more than 15 thousand acres of land, water, and interests subject to certain limitations, and shall maintain administrative and information facilities thereon. After acquisition of sufficient lands to insure the realization of the Act, the Secretary shall establish the Florida Frontier Historic Riverway by publication in the Federal Register. The Secretary shall study and may designate additional sites from incorporation within the Riverway, some of which are listed. Administration will be under the Secre-

tary, and recreational activities shall be permitted, except that he may designate zones and periods when such activities will not be allowed. (Sutton-Florida)
W74-06217

SUPERVISION OVER LOCAL SANITATION.
W. Va. Code Ann., sec. 16-1-9 (1973).

Descriptors: *West Virginia, *Legislation, *Sewage disposal, *Sewage treatment, *Waste disposal, Water supply, Wastes, Water pollution sources, Waste water treatment, Waste water disposal, Sanitation, Sanitary engineering, Environmental engineering, Water quality, Water quality control, Drainage, Public health.

No person, firm, company, corporation, public or private institution, county or municipality shall install or establish any system or method of drainage, water supply, sewage or excreta disposal, or solid waste disposal without first obtaining a written permit from the West Virginia director of health. All such systems or methods shall be installed or established in accordance with plans, specifications and instructions issued by the state director of health. Whenever the director finds that the system or method has not been installed according to plans, specifications or instructions issued by him, he may issue an order requiring the owner to make alterations as may be necessary to correct the condition. The presence of sewage, excreta or solid waste being disposed of in a manner not approved by the director shall constitute prima facie evidence of the existence of a condition endangering public health, constituting a misdemeanor. (Silber-Florida)
W74-06218

MUNICIPALITIES--WATER MAINS.
Conn. Gen. Stat. Ann. sec. 7-137c (Supp. 1972), as amended, Act 73-446, sec. 7-137c (1973). Pub. Acts of Conn.

Descriptors: *Connecticut, *Conduit, *Hydraulic structures, *Government finance, *Tax rate, Operating costs, Appraisals, Assessments, Concrete pipes, Water conveyance, Cost sharing, Separable cost allocation, Legislation, State governments, Legislation, Legal aspects, Zoning, Taxes, Cities, Governments.
Identifiers: *Administrative regulations.

Any Connecticut municipality may appropriate funds to extend water mains into industrial, commercial, or residential areas and assess adjoining property owners for costs incurred. Each owner of property abutting such main shall reimburse the municipality for his proportionate share assessed according to rules adopted by each municipality. The only exception is for unimproved land, and deferment from payment will cease when the land is built upon or a building permit is issued. Record of this deferred assessment is to be kept by the municipality on its land records. The assessment represents a reasonable proportion of the total cost of such mains, including materials, installations and pumping stations. If the use of the land does not conform with its zoning classification, the assessment will be made on another equitable basis. If the water main is to be used for municipal purposes, the municipality shall contribute a fair proportion of the expense. The owner of any assessed land can appeal his assessment to the county court within sixty days. (Sperling-Florida)
W74-06219

NAVIGATION--BOATING SAFETY AND REGULATIONS.
Conn. Gen. Stat. Ann. secs 15-121, 15-125, 15-155, 15-156 (Supp. 1972), as amended, Act 73-257, secs 1, 3, 20, 21, 22, 23, 24, 25 (1973), Pub. Acts of Conn.

Descriptors: *Connecticut, *Statute, *Boating, *Recreation, Legislation, State governments, Oily water, Water pollution sources, Environmental sanitation, Public health, Buoys, Administration, Costs, Administrative agencies, Regulation, Water, Navigable waters, Navigation, Water resources, Water pollution control, Water law.
Identifiers: *Administrative regulations, *Navigation, Obstructions.

The Connecticut Commissioner of Environmental Protection has power to investigate matters relating to boating sanitation. He can adopt regulations to provide for public safety and environmental quality and to promote the safe use and protection of waters. Anyone aggrieved by an order of the Commissioner may appeal to the county court. State fees for registering of motor boats go into a fund from which expenses of the Commissioner of Environmental Protection are paid. Also, any town which incurs an expense in enforcing regulations on pollution from vessels can be reimbursed from this fund. The Commissioner will examine requests for reimbursement and allow those which are reasonable and necessary. The Commissioner can cause to be removed any marker, raft, etc. in any waters of the state which he finds to be a hazard to public use or a menace to navigation. (Sperling-Florida)
W74-06220

HARBORS AND RIVERS.
Conn. Gen. Stat. Ann. secs. 15-1, 15-2, 15-7, 15-8, 15-13 to 15-15B, 15-19, 15-21, 15-25, 15-26a (Supp. 1972), as amended, Act 73-486, sec. 15-1, Act 73-405, secs. 1,2,3,4 (1973), Pub. Acts of Conn.

Descriptors: *Connecticut, *Legislation, *Harbors, *Port authorities, *Ports, Water law, Navigation, Pollution control, Pollution abatement, Water quality, Water quality control, Rivers, Streams, Water policy, Multiple-purpose projects, Transportation, Ships, Reasonable use, Tidal waters, Permits.
Identifiers: Harbor masters.

The governor of Connecticut is directed to appoint harbor masters for the major harbors and ports of the state. The harbor masters shall be responsible for the general care and supervision of their harbor and its tidewaters, rivers and flats, to prevent and abate sources of water pollution and to prevent or remove unauthorized encroachement and other obstructions likely to interfere with navigation. They shall also have the power to station all vessels at anchor within the harbor under their authority. The Commissioner of Environmental Protection may license as many citizens as he deems necessary and finds qualified to act as pilots in any ports and waters of the state. All inward and outward bound vessels of foreign or American registry, drawing nine (9) or more feet of water, entering or departing from any port in this state, shall require a licensed pilot. (Silber-Florida)
W74-06221

GAME AND FRESH WATER FISH.
Fla. Stat. Ann. sec. 372.85 (Supp. 1973).

Descriptors: *Mining, *Legislation, *Water pollution, *Water pollution control, *Law enforcement, Administration, Legal aspects, Florida, Water pollution sources, Water quality, State governments, Abatement, Pollutant identification, Oil wastes, Mine wastes, Fish conservation, Sawdust, Dyes, Poisons.

Contamination is prohibited of the fresh running waters of the state of Florida with quantities of deleterious substances sufficient to injure, stupefy or kill fish inhabiting those waters. An exception is provided for those persons or businesses engaged in the mining industry as long as precautionary measures approved by the Game and Fresh Water Fish Commission are observed. Violation of there provisions is a second degree misdemeanor (Sutton-Florida)
W74-06222

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM.
Federal Register, Vol 38, No 7, p 1362-70 (1973).

Descriptors: *Legislation, *Regulations, *Permits, *Discharge, *Pollutants, Administrative agencies, Control, Waste discharge, Sewage discharge, Effluents, Sewage treatment, Waste treatment, Industrial pollutants, Industrial wastes, Water quality control, Navigable waters, Oceans, Standards, Water pollution, Water pollution sources, Pollution abatement, Pollution control, Impaired water quality, Legal aspects, Water law, Water policy.
Identifiers: Contiguous zone.

The Environmental Protection Agency (EPA) has proposed regulations to serve as guidelines for the issuing or denial of pollution discharge permits pursuant to the Federal Water Pollution Control Act Amendments of 1972. Permit holders are required to achieve by July 1, 1977 effluent limitations which require the application of the best practicable waste control technology currently available. Publicly owned treatment works are required to achieve secondary treatment by the same date. In addition, all point source dischargers must comply with applicable water quality standards requirements. All discharges from point sources into the navigable waters, waters of the contiguous zone, and the oceans are unlawful unless the discharger possesses a valid permit or is excluded from coverage by law. Any discharge of sewage sludge that results in any pollutant from sewage sludge entering the navigable waters is prohibited. (Silber-Florida)
W74-06223

WATER AND SEWER SYSTEM REGULATORY LAW.
Fla. Stat. Ann., secs. 367.011 through 367.181 (Supp. 1973), as amended, act 193, sec. 1, act 333, sec. 100 (1973) Fla. Laws.

Descriptors: *Florida, *Public utility districts, *Water distribution(Applied), *Governments, Water quality, Public health, Public utilities, Water rates, Distribution patterns, Drainage systems, Sewer, Water conservation, Water management(Applied), Legislation, Regulation, Water quality standards, Sewage treatment, Water.
Identifiers: *Administrative regulations, *Certification.

The Florida public service commission is given exclusive jurisdiction over each utility operating water and sewer systems with respect to its authority, service, and rates. Exempted from regulation under this statute are the bottled water industry, governmentally owned water and sewer systems, systems designed to serve fewer than one hundred persons, non-profit corporations, as well as some other systems. Each utility is required to obtain a certificate authorizing it to provide service. The statute specifies the application procedure and what the application should contain, as well as provisions for a hearing if an objection is expressed to the application. No certificate will be issued for a new system or an extension of an old system unless the present facility is inadequate. Also, no transfer of facilities or organizational control can take place unless the commission deems it to be in the public interest, and rates cannot be changed without commission approval. The commission also has power to regulate standards of quality, service, repairs and improvements. The commission may enter the premises of any utility and investigate and conduct tests, or exercise any power conferred by this statute. (Sperling-Florida)
W74-06224

SUPERVISORY UNIONS.
Vt. Stat. Ann., Title 10, secs. 451-457 (1968).

Descriptors: *Vermont, *Legislation, *Adoption of practices, *Coordination, *Management, Administrative agencies, Regulation, Conservation, Natural resources, Water, Water resources.

Natural resources conservation districts in Vermont are authorized to form supervisory unions for administrative purposes while still retaining their individual identities, duties and powers. The unions will help carry out a broadened program of conservation, development and use of natural resources, as well as coordinating and cooperating with state, federal and local agencies. A union may be formed by petition of two or more districts to the state natural resources conservation council, and the subsequent determination by the council that such a union is feasible and in the best public interest. The union shall offer appropriate assistance to member districts, employ a union conservationist, enter into agreements with other agencies in planning for the conservation, development and use of natural resources. The union conservationist shall implement programs of the member districts and perform the duties as set by the directors. He shall endeavor to coordinate programs and plans for the member districts as well as report to the directors on his activities and the needs of the districts within the union. (Siber-Florida)
W74-06225

PRIVATE SEWER SYSTEMS.
Ohio Rev. Code Ann. secs 6112.01-6112.04 (Supp. 1972).

Descriptors: *Ohio, *Sewage, *Sewage treatment, *Legislation, *Water law, *Water pollution control, Waste disposal, Waste treatment, Public utilities, Environmental engineering, Structural design, Treatment facilities, Waste, Pollution abatement, Water quality control, Sewer districts.

The Ohio director of environmental protection upon receipt of an application from any person, may determine on the basis of public health, safety, convenience or welfare the necessity for approving general plans for the construction and installation of a disposal system for the disposal of sewage, industrial waste or other wastes. For the purpose of preventing, controlling and abating new or existing pollution of the waters of the state, the plans may serve any geographical area in one or more counties provided that area is not already being served by a sewage disposal system. To be approved by the director, the plans must be accompanied by written certification from the public utilities commission authorizing the construction, installation and operation of such facilities. The construction of approved facilities shall be performed under supervision of a registered engineer, in a manner acceptable to the director, and at the applicant's expense. (Silber-Florida)
W74-06226

WATER POLLUTION CONTROL AND PUBLIC WATER SUPPLY.
Ohio Rev. Code Ann., secs. 6111.12-6111.30, 6111.41-6111.46, 6111.99 (Supp. 1972).

Descriptors: *Water pollution control, *Watershed management, *Ohio, *Impaired water quality, *Public health, Fluoridation, Flood plain, Water pollution sources, Water resources, Water conservation, Flood control, Recreation, Flood plain zoning, Water supply, Water quality, Legislation, Administrative agencies.
Identifiers: *Administrative regulations, Nuisance.

Whenever there is filed with the environmental protection agency a complaint, in writing, that a public water supply is impure, dangerous, or does not contain requisite amounts of fluoride, there will be an investigation by the director of environmental protection. The environmental protection agency supervises operation and maintenance of all water systems, public, and private if of a public or quasi-public nature. Fluoridation of the water supply can by petition be put on the ballot of a special election. Water-works systems are required to have analysis made of the water at such intervals as the environmental protection agency may order. If the agency orders changes to be made in the system that will make the water systems operation less profitable, an application can be made to the public utilities commission for rate increases. Plans for development, use, and protection of water resources shall be made including recreation, fish, wildlife, flood control, and flood plan management. The agency will also collect, study, and interpret all data pertaining to the supply use, conservation, and replenishment of the underground and surface waters of the state, and shall give such information to anyone who asks for it. The agency will approve all plans for changes in existing systems, new systems, as well as plans for disposal of waste. (Sperling-Florida)
W74-06227

LOCAL RIVER MANAGEMENT.
Mich. Comp. Laws Ann. secs 323.301-323.320 (Supp. 1973).

Descriptors: *Legislation, *Michigan, *Water management, *River regulation, Water law, waste water disposal, Water conservation, Water utilization, Reservoir operation, Flood control, Water levels, Reservoirs, Rivers, Levees, Dams, Water resources, Flow, Water distribution, Water control, Water storage.

The Michigan Watershed Council shall be established to promote cooperation among local governments in river management. The Council May conduct studies of water resources, water uses and streamflow levels. It may advise federal, state and local agencies on the watershed's problems and needs, and cooperate with those agencies in their undertakings of various tests and studies. Two or more local governments may petition the Water Resources Commission to establish a River Management District. The District will serve as the agency to acquire, construct, operate and finance water storage and other river control facilities necessary for river management. A district board may conduct studies necessary to make their functions operational, impound and control river waters subject to the minimum streamflow levels, operate reservoirs, and perform the functions of the Council if a council has not been formed within the district. The Commission shall determine the minimum stream flow level for each district necessary to safeguard the public health, welfare and safety. No river management plan shall take effect until approved by the Commission. (Silber-Florida)
W74-06228

WATER RESOURCES COMMISSION.
Mich. Comp. Laws Ann., secs. 323.1 through 323.13 (Supp. 1973), as amended, act 3, sec. 1 (1973) Mich. Pub. Acts.

Descriptors: *Water resources, *Water quality control, *Michigan, *Pollution(Water), *Water pollution control, Conservation, Wastes, Discharges, Legislation, Rivers, Floodways, Permits, Regulation, Administrative agencies, State governments, Governmental interrelations, State jurisdiction, Water pollution sources.
Identifiers: Administrative regulations.

A water resources commission is created to protect and conserve the water resources of the state of Michigan. The commission has control over the pollution of any waters of the state and over the alteration of the watercourses and the flood plains of all rivers and streams. The commission also has the power to make rules governing the water resources of the state. The commission requires registration of manufacturing products, production materials and waste products for all operations in which wastes are discharged. It also requires permits to regulate the discharge or storage of any substance which may affect the quality of the waters and is authorized to establish permit restrictions and programs to assure compliance with applicable federal and state law. The commission is given the power to prohibit pollution of the state's waters, to prohibit the obstruction of floodways of the rivers and streams of the state, and to negotiate with other governments or agencies in matters concerning the water resources of the state. Penalties for violations are provided. (Daniels-Florida)
W74-06229

RUCKER V. WILLIS (SUIT TO ENJOIN CONSTRUCTION).
484 F.2d 158-164 (4th Cir. 1973).

Descriptors: *Judicial decisions, *Construction, *Habitats, *Ecology, Environment, Appeals, Governmental interrelations, *North Carolina, Legal aspects, Balance of nature, Environmenal engineering, Project planning, Wildlife conservation, Scenery, Economics, Environmental effects, Marinas, Coasts, Shores, Piers, Engineering structures, Legislation.
Identifiers: Injunctive relief, National Environmental Policy Act(NEPA), Environmental impact statement(EIS).

The plaintiffs seek to enjoin construction of a marina and pier alleging that the Army Corps of Engineers acted in violation of 33 U.S.C. sec 403 (1972) in issuing a construction permit without first preparing an environmental impact statement. The court affirmed the District Court's ruling that issuance of the permit was legal in light of the applicable statute, and applicable regulation, both requiring an environmental impact statement if their conditions are met, but do not require a negative finding or statement. The court also held 'controversial' not to be synonymous with 'opposition', and in light of all the circumstances such as the project's isolated nature, lack of involvement with marshlands, or destruction of shellfish beds, and the fact that similar structures had already been constructed, the Corp's actions were therefore not arbitrary and no abuse of discretion was evident. The opinion also noted the compliance with the notice requirement. The dissenting opinion noted that since the construction could ultimately affect the environmental nature of the area concerned, an injunction should be issued pending a trial on the merits. AIRTEX PRODUCTS, INC. V. POLLUTION CONTROL BOARD (AN APPEAL FROM AN AGENCY IMPOSED FINE FOR DISCHARGE OF CYANIDES INTO SEWER SYSTEM).
303 N.E.2d 498 (Ill. Ct. App. 1973).

Descriptors: *Illinois, *Judicial decisions, *Legal aspects, *Water pollution, *Sewage treatment, Water pollution sources, Sewers, Sewage disposal, Sewage, Industrial wastes, Water pollution treatment, Regulation, Penalties(Legal), Administrative agencies, Constitutional law, Water

quality, Pollutants, Toxins, Industrial pollution, Municipalities, Pollution abatement, Water quality control.
Identifiers: *Cyanides.

The Illinois Environmental Protection Agency brought enforcement action against a corporation for alleged violations of a regulation relating to discharge of cyanides in municipal sewer systems and sewer treatment works. The state's Pollution Control Board imposed a fine for that violation and the Corporation appealed, presenting numerous contentions. First, the petitioner contended that the imposition of a discretionary penalty is a judicial and not an administrative function, thereby violating the separation of powers doctrine of the Illinois Constitution. The District Court agreed. Secondly, it was asserted that the regulation was unconstitutional as an unlawful delegation of legislative authority. The Court held that the regulation was reasonably related to accomplishing the purpose of the Environmental Protection Act, that is, maintaining the purity of the water. Third, the corporation contended that the regulation was unconstitutional because property is taken without due process. Appellant argued that the right to connect to the city sewer system is a property right which cannot be divested, but the Court held that such right was subject to reasonable regulations. Procedural objections were also made and were dismissed by the Court. (Ritchie-Florida)
W74-06323

EPPS V. FREEMAN (ACTION TO CLEAR TITLE ON FILLED SWASH AREAS BETWEEN PROPERTY AND THE SEA).
200 S.E.2d 235 (S.C. 1973).

Descriptors: *Judicial decisions, *South Carolina, *Legal aspects, *Riparian rights, *Easements, Coasts, Recreation, Consititutional law, Navigable waters, Adverse possession, Accretion(Legal aspects), Bulkheads, Boundary disputes, Boundaries(Property), Land use, Land reclamation, Land development, Water policy, Water law.
Identifiers: *Swash areas.

Persons claiming by will or inheritance under subdividers of a tract of ocean front property brought an action against lot owners in the subdivision to clear the title to areas in the subdivision between the platted lots and the sea. The Supreme Court of South Carolina held that evidence of sporadic efforts by the lot owners to fill a swash area between the lots and the sea, and use by them of the swash area for recreational purposes, was insufficient to show title by prescription or accretion. But while the lot owners therefore did not have title to the land in dispute, they had a speical property interest therein, whether by implied grant, estoppel or otherwise, which barred plaintiffs from the relief sought by the complaint. Generally, where property sold is described in the conveyance with reference to a plat on which streets, parks and other open areas are shown, an easement therein is created in favor of the grantee. Such an easement is part of the property to which the grantee is entitled and of which he cannot be divested except by due process of law. (Ritchie-Florida)

WETLANDS.
Va. Code Ann., sec. 62.1-13.1 thru 62.1-13.20 (1972).

Descriptors: *Virginia, *Water policy, *Legislation, *Wetlands, *Conservation, Wildlife habitat, Aquatic habitat, Flood control, Erosion control, Land use, Land development, Recreation, Wildlife conservation, Environmental effects, Ecology, Marshes, Ecosystems, Biological communities, Estuaries, Pollution control, Pollution prevention, Natural resources, Water resources development.

The unique character of the wetlands is recognized as an irreplaceable natural resource, which in its natural state, is essential to the ecological systems of the tidal rivers, bays and estuaries of the state of Virginia. This resource is essential for the production of marine and inland wildlife, waterfowl, finfish, shellfish and flora, is a valuable and protective barrier against floods, tidal storms and erosion of the shore and soils as well as an absorber of silt and pollutants. Continued destruction of the state's coastal wetlands will greatly contribute to the pollution of its rivers, bays and estuaries, diminish the abundance of plant and wildlife as food sources and deprive the state of employment and recreational resources. To protect these essential resources it is declared to be the policy of the state to preserve the wetlands and to prevent their despoilation and destruction and to accomodate necessary economic development in a manner consistent with wetlands preservation. Wetlands of primary ecological significance shall not be altered so that the ecological systems are unreasonably disturbed and any development shall be concentrated in wetlands of lesser ecological significance. (Silber-Florida)

SHORE EROSION CONTROL.
Va. Code Ann., secs. 21-11.16 thru 21-11.19 (1972).

Descriptors: *Virginia, *Erosion control, *Legislation, *Water control, *Land management, Water policy, Conservation, Bank protection, Soil management, State governments, Administrative agencies, Coordination, Cooperation, Water quality, Water quality control, Environmental effects, Project purposes, Project planning, Land development, Recreation, Water resources, Water resources development.

The shores of the state of Virginia are a most valuable resource that should be protected from erosion, which reduces the tax base, decreases recreational opportunities and decreases the amount of open space and agricultural lands. Shore erosion also damages or destroys roads, produces sediment that damages marine resources, fills navigational channels, degrades water quality and in general, adversely affects the quality of the environment. The Virginia Soil and Water Conservation Commission shall have the duty and responsibility to make the necessary coordination of shore erosion control programs throughout the state and to secure the cooperation and assistance of the United States to protect waterfront property from destructive erosion. The Commission shall evaluate the effectiveness of current programs and explore all facets of the problem and alternative solutions to determine the most practical and economic methods to control shore erosion. The Commission is authorized to employ one shore erosion engineer to assist in carrying out the coordination responsibility of shore erosion programs and to provide technical assistance to soil and water conservation districts. (Silber-Florida)

A BILL TO AMEND THE WILD AND SCENIC RIVERS ACT BY DESIGNATING SEGMENTS OF CERTAIN RIVERS IN THE STATE OF COLORADO FOR STUDY AS POTENTIAL COMPONENTS OF THE NATIONAL WILD AND SCENIC RIVERS SYSTEM.
House Bill 11698, 93rd Cong, 1st Sess (1973). 3 p.

Descriptors: *Rivers, *Legislation, *Legal aspects, *River systems, *Conservation, Water resources development, Natural resources, Preservation, Financing, Projects, Project planning, Water law, Water policy, Scenery, Aesthetics, Wild rivers.
Identifiers: National Wild and Scenic Rivers Act.

The Colorado Rivers Preservation Act of 1973 designates segments of certain rivers in the state of Colorado for study as potential components of the National Wild and Scenic Rivers System. Segments proposed to be included in the system, include North Platte River, Green River, Yampa River, Gunnison River, Big Thompson River, Poudre River, Los Pinos River, Conejos River, Elk River, Laramie, Michigan River, Piedra River and Encampment River. A segment of the Dolores River has been suggested for inclusion, provided that such classification does not inhibit any development or project planned at the time of enactment, proposed or conducted by the state of Colorado or the federal government. Necessary appropriations have been authorized to carry out this Act, not to exceed $2,250,000. (Ritchie-Florida)

DEPARTMENT OF FISH AND WILDLIFE.
N.Y. Environmental Conservation Law, sec. 11-0303, p. 164-165 (1972).

Descriptors: *New York, *Legislation, *Natural resources, *Environment, *Ecology, Fish, Wildlife, Habitats, Habitat improvement, Recreation, Public rights, Public health, Interagency cooperation, Wildlife management, Fish management, Conservation, Planning, Aquatic habitats.

New York has granted to the department of fish and wildlife powers necessary for efficient management of fish and wildlife resources of the state. These resources are deemed to include all animal and vegetable life and the soil, water and atmosphere owned or managed by the state, to the extent that they constitute the habitat of fish and wildlife. Management includes both the maintenance and improvement of these resources as well as the development and administration of measures for making them accesible to the people of the state. The department is empowered to cooperate with the federal government and with other political subdivisions within the state, as well as with owners and lessees of privately owned lands and waters. The department shall also develop programs to promote natural propagation and maintenance of desirable species. In so doing, it shall take into account the following: ecological factors, including the need for restoration and improvement of natural habitats; the compatibility of production and harvesting of fish and wildlife crops with other necessary or desirable land uses; the importance of such resources for recreational purposes; requirements for public safety; and protection of private premises for hunting, fishing or trapping. (Ritchie-Florida)

UNITED STATES OCEANS POLITICS,
Johns Hopkins Univ., Washington, D.C. School of Advanced International Studies.
A. L. Hollick.
San Diego Law Review, Vol 10, No 3, p 467-501, May 1973. 2 tab, 44 ref.

Descriptors: *Political constraints, *Law of the Sea, *Continental shelf, *Oceans, *Governmental interrelations, Administration, Coasts, Federal government, International law, Treaties, Law enforcement, Jurisdiction, Organizations, Industries, Commercial fishing, Oil industry, United States, United Nations.

The U.S. policy with regard to seabed minerals favors a narrow zone of national jurisdiction and establishment of an international seabed regime beyond this zone. The 200 meter isobath national jurisdiction brought some dissatisfaction, therefore the policy provisions have been delineated by administrative machinery. The best way to examine oceans policy is in keeping the typical bureaucratic political model in mind. The history of U.S. seabed policy and conflicts within the two main groups, the petroleum industry and the Defense Department are described. After many failures, the National Security Council adopted

the State Department compromise regarding seabed policy, whose principal strategy was to encourage other nations to adopt a narrow Continental Shelf policy. The U.S. stance on Territorial Sea, Straits and Fisheries Policy is outlined. At the U.N. Law of the Sea Conference hopefully the U.S. will realize the desired tradeoffs; a narrow Continental Shelf for a generous seabed regime and freedom of transit. The domestic perspective is outlined and the effects of military interest, shift of position in industry and the energy crisis, are discussed. The net effect, while seemingly evolving toward a coastal state approach with greater support in legislation, is difficult to ascertain at present. (Sutton-Florida)

ENVIRONMENTAL LAW--ZONING--ORDINANCE PROHIBITING FILLING WETLANDS ADJACENT TO NAVIGABLE WATERS WITHOUT PERMIT IS CONSTITUTIONAL EXERCISE OF POLICE POWER NOT REQUIRING PAYMENT OF COMPENSATION.
Harvard Law Review, Vol 86, p 1582-1592, 1973. 56 ref.

Descriptors: *Wetlands, *Legal aspects, *Constitutional law, *Zoning, *Eminent domain, Public rights, Navigable waters, *Wisconsin, Judicial decisions, Regulation.
Identifiers: Just compensation.

The constitutionality is discussed of zoning ordinances designed to protect wetlands but which are attacked as being a taking without just compensation. The center of discussion is a Wisconsin case. By adopting a broad definition of harm in a case where public rights infringed by the private landowners are traditional and clear, the case suggests a mechanism by which strict regulation of wetlands use, or of other land uses affecting the public interest in navigable waters, might be upheld even though the regulations provide for no compensation to the property owners. Whether a later court will reach the same outcome when less well-established public rights to protection of the environment are involved remains an open question, although the instant court's expansion of the concept of harm certainly permits movement in that direction. The issue is important for states and municipalities since a requirement that the owner be compensated for use restrictions imposed on wetlands makes preservation of such areas considerably less likely. HOW EFFECTIVE ARE ENVIRONMENTAL IMPACT STATEMENTS.
Oregon State Univ., Corvallis. Water Resources Research Inst.
Available from the National Technical Information Service as PB-230 702; $4.00 in paper copy, $1.45 in microfiche. Seminar WR 017.73, Papers presented in Spring Quarter 1973, published July 1973. 85 p, 11 fig, 5 tab, 28 ref.

Descriptors: *Environmental control, *Environmental effects, *Project planning, *Decision making, Safe yield, Social participation, Inter-agency cooperation, Regional development, Social impact, Adoption of practices, Legislation, Federal government.
Identifiers: *Environmental impact statements.

The Environmental Impact Statement is defined, its effects on the policies and programs of the Atomic Energy Commission, Bureau of Reclamation, Corps of Engineers, and the Oregon Highway Division examined, and suggestions are made on ways to improve the statements. The 1969 Environmental Policy Act (NEPA) requires that Environmental Impact Statements be prepared for projects significantly affecting the natural and human environment. The Council on Environmental Quality, also created by NEPA, has limited responsibilities in aiding in their preparation; the Council cannot demand preparation of the statement, neither can it order changes in proposed projects. Criticism of the statements centers on their failure to define impacts to be studied, to provide measurement tools, and to increase local participation in environmental planning. While the statements have forced agencies to be aware of environmental impacts, the increased workloads have caused the statements to be a separate rather than an integral part of the planning process. The development of a composite score, formed by examining the project's impact on the ecology, economy, and health and safety of the region is suggested as one way of selecting the best alternative. Regional information gathering systems are proposed to better integrate environmental impacts and public concern into the planning process. (See W74-06108 thru W74-06116) (Schroeder-Wisconsin)
W74-06107

WHAT IS AN ENVIRONMENTAL IMPACT STATEMENT,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
P. C. Klingeman.
In: How Effective are Environmental Impact Statements, Oregon State Univ., Corvallis, Water Resources Research Institute Seminar WR 017.73, July 1973. p 1-9.

Descriptors: *Environmental control, *Environmental effects, *Project planning, Federal government, State governments, Decision making, Legislation.
Identifiers: *Environmental impact statements.

An environmental impact statement evaluates a proposed project's impact on the natural and human environment and is a requirement of the 1969 National Environmental Policy Act. The document is submitted to other agencies for review and comment. The revised document along with the reviewers' comments are submitted to the Council of Environmental Quality. The Council, however, has no power to change the character of the project. Enforcement of proposed changes rests, at present, on public opinion and court action. The statement consists of a description of the proposed action, of existing conditions, of resultant alterations of existing conditions, and of probable environmental consequences. In the latter instance, resources and areas affected, and short-term impact characteristics are identified The possibility of modifying these impacts is also required. The effectiveness of these statements has been hindered by the difficulty in quantifying environmental impacts and in integrating the statements in the planning process. Agencies have often recognized these problems and are continuing attempts to rectify them. (See also W74-06107) (Schroeder-Wisconsin)

CEQ - A VIEW FROM THE TOP,
Council on Environmental Quality, Washington, D.C.
B. P. Jenny.
In: How Effective are Environmental Impact Statements, Oregon State Univ., Corvallis, Water Resources Research Institute Seminar WR 017.73, July 1973, p 11-18.

Descriptors: *Decision making, *Environmental control, Legislation, Federal government, Project planning, Alternate planning.
Identifiers: *Council on Environmental Quality, National Environmental Policy Act, Environmental impact statements.

The 1969 National Environmental Policy Act (NEPA) requires agencies to prepare and circulate an analysis of the environmental impacts of projects constructed by federal agencies, funded by federal grants or under federal regulation. The decision to submit the statements rests entirely with the agency, although growing case law has limited this discretion. The Council of Environmental Quality (CEQ), also established by the Act, has limited power over these statements. While the Act requires submission of the statement to the Council, it cannot demand preparation of the

statement or order changes in the agency's proposed action. The limited size of the CEQ staff also makes it virtually impossible for the Council to examine any particular project in detail. The Council has confined itself to preparation of procedures to implement the NEPA and in aiding agencies to conform to the Act. It has identified recurring problems requiring administrative or legislative reform, including the degree of integration of the statement into the planning process, inclusion of opposing views, and the adequacy of the assessment of alternative actions. The Council's role is best described as conciliatory, attempting to persuade agencies to implement not only the provisions but also the spirit of the NEPA. (See also W74-06107) (Schroeder-Wisconsin)
W74-06109

EPA REVIEW OF THE EIS,
Environmental Protection Agency, Seattle, Wash.
W. D. Jaspers.
In: How Effective are Environmental Impact Statements, Oregon State Univ., Corvallis, Water Resources Research Institute Seminar WR 017.73, July 1973. p 15-18.

Descriptors: *Project planning, *Environmental control, *Decision making, Legislation, Federal government, Social aspects, Inter-agency cooperation.
Identifiers: *Environmental impact statements, *National environmental policy act.

The 1969 National Environmental Policy Act (NEPA) requires federal agencies to undertake a number of activities among the most publicized of which is the Environmental Impact Statement (EIS). The immediate question raised is whether projects have improved as a result of these statements. While the immediate reaction is 'very little,' it is important to realize that the statement is part of a planning process. It has been suggested that because of the statements, fewer unsound projects have been inaugurated. Additional elements of the EIS process include a required interdisciplinary approach and improved quantification of environmental effects. Agencies have created new staff positions to accomplish these ends, although implementation of new quantification methods has been limited. Increased interaction has also resulted as agencies aid state, local, and international bodies in preparing impact statements as well as soliciting their comments on the agencies' own actions. The agencies are also required to consider a variety of alternatives and their consequent environmental impacts in choosing an activity. While it is different to assess whether this is actually being done, it is obvious that NEPA and EIS have increased awareness and discussion of the environmental impacts of an agency's action, which considerably implements the NEPA's goals. ENVIRONMENTAL ASPECTS OF THE POWER INDUSTRY,
Portland General Electric Co., Oreg.
R. L. Kathren.
In: How Effective are Environmental Impact Statements. Oregon State Univ., Corvallis, Water Resources Research Institute Seminar WR 017.73, July 1973, p. 19-30. 2 fig, 18 ref.

Descriptors: *Nuclear powerplants, *Environmental effects, Decision making, Regulation, Administrative agencies, Thermal pollution, Radioactive wastes, Permits, Construction, Operations, Baseline studies, Cost-benefit analysis, Radioactivity.
Identifiers: *Environmental Impact Statements, Atomic Energy Commission, Environmental Reports.

There are 28 power reactors in the U.S. producing 2% of the total power generated; in three decades, reactors will produce over 20%. The Atomic Energy Commission has always required an evaluation of the environmental impacts from radiation. The 1969 National Environmental Policy Act (NEPA) and the Calvert Cliffs decision have expanded this concern to cover impacts from heat, chemicals, and evaporation. The examination of environmental impacts begins with an Environmental Report (ER), submitted by the applicant seeking a construction permit. A second report is required to obtain an operating license. These reports contain scientific data used to compare conditions with and without the reactor. A monitoring program is conducted to identify existing radiation sources and potential radiation recipients. The ER also evaluates alternative sites and their consequential effects. The ER and AEC's independent research provide data sources to prepare the Environmental Impact Statement. Much of this data can be found in the AEC's Safety Analysis. The resultant duplication provides an extensive albeit expensive revelation of possible environmental impacts of nuclear power plants. While the statement has been subject to widespread criticism it does reflect an attempt to comply with the spirit of the NEPA. (See also W74-06107) (Schroeder-Wisconsin)
W74-06111

THE BUREAU OF RECLAMATION AND RESOURCE DEVELOPMENT,
Bureau of Reclamation, Boise, Idaho.
J. R. Woodworth.
In: How Effective are Environmental Impact Statements., Oregon State Univ., Corvallis, Water Resources Research Institute Seminar WR 017.73, July 1973, p. 31-35.

Descriptors: *Project planning, *Environmental effects, Decision making, Environmental control.
Identifiers: *Environmental Impact Statements, National Environmental Policy Act, Bureau of Reclamation.

The 1969 National Environmental Policy Act and requisite Environmental Impact Statement (EIS) has affected the Bureau of Reclamation in a number of ways. While they have significantly affected the organization and philosophy of the Bureau, the statement has placed a demanding workload forcing its attention to the problem of environmental impacts. To handle this increase workload, an environmental staff was established in 1970-71 infusing the Bureau with affirmative environmental stances. The cost of an Environmental Impact Statement averages over $25,000 and takes over eight months preparation. The process of environmental review, statement preparation, and public review has a direct impact in modifying and/or cancelling a number of the Bureau's proposed projects. The environmental staff provides benefits in addition to the preparation of EIS. These include environmental education programs, environmental improvement programs for operating Bureau objects, and affirmative steps to include additional environmental programs in developing projects. While it is conceded that Environmental Impact Statements do not guarantee that environmental damage will not occur, they do provide public review to minimize adverse effects. ENVIRONMENTAL POLICIES OF THE CORPS OF ENGINEERS,
Corps of Engineers, Portland, Oreg. North Pacific Div.
N. E. Saling, Jr.
In: How Effective are Environmental Impact Statements., Oregon State Univ., Water Resources Research Institute Seminar WR 017.73, July 1973, p 37-47.

Descriptors: *Environmental effects, *Project planning, *Decision making, Regional development, Water resources development, Inter-agency cooperation, Social participation, Social values, Legal aspects.
Identifiers: *Environmental Impact Statements, National Environmental Policy Act, Environmental assessment procedure.

In 1972, the Corps of Engineers implemented an eleven step procedure for assessing the environmental impact of alternative project designs by projecting an environmental profile over time for each design. Feedback was solicited from various sources, including public meetings, before a final recommendation and statement of findings was made. Environmental Impact Statements also provide information to the public about the impact of selected alternatives. The requirements for an adequate statement, however, have continued to change resulting in a transition from a brief report to a voluminous statement generating high costs in time and money. Because statements must be made for projects from those just initiated to those nearing completion, a tremendous backlog of work has been created. The impact statement is effective in informing the public and increasing their awareness. As a decision device, however, it is less successful because unlike the public meeting in the assessment process, the statment is less able to create a climate of accommodation. It seems, therefore, that the Corps existing assessment procedure best encompasses the spirit of the National Environmental Policy Act. (See also W74-06107) (Schroeder-Wisconsin)

HIGHWAYS AND ENVIRONMENT,
Oregon State Highway Div., Salem. Environmental Section.
J. B. Kennedy.
In: How Effective are Environmental Impact Statements., Oregon State Univ., Corvallis, Water Resources Research Institute Seminar WR 017.73, July 1973, p 49-59. 4 fig, 2 ref.

Descriptors: *Environmental effects, *Highways, *Project planning, Social impact, Social participation, Decision making, *Oregon, Regions.
Identifiers: *Environmental Impact Statements, Oregon Highway Division, National Environmental Policy Act, Action Plan.

The effects of recently required Environmental Impact Statements in the development of programs and policies by the Oregon State Highway Division is examined. The most obvious result has been an increased workload occasioned by the preparation of the statements. To accomplish this task, a separate Environmental Section was created, composed of an environmental coordinator, an air quality engineer, and a highway ecologist. The large volume of statements has limited the section's activities to their preparation. Utilization of highway personnel in a regional approach may allow a speed-up in the preparation of impact statements and greater integration of environmental concerns into the planning process. The highway division has proposed dividing the state into five regions according to physical, sociological, and economic similarities and assigning a Regional Environmentalist to each. His duties would include information gathering and dissemination to the public, environmental monitoring, and creation and maintenance of a regional data center collecting physical, land use, social, economic, and transportation data over time. The readily available data would enable more comprehensive public discussion and prompt incorporation of environmental effects into the planning process. (See also W74-06107) (Schroeder-Wisconsin)

TOMORROW'S ENVIRONMENTAL BENEFIT-COST ANALYSIS,
Battelle-Pacific Northwest Labs., Richland, Wash.
J. B. Burnham.
In: How Effective are Environmental Impact Statements., Oregon State Univ., Corvallis, Water

Resources Research Institute Seminar WR 017.73, July 1973, p 61-73. 2 fig, 3 tab, 10 ref.

Descriptors: *Environmental effects, *Cost-benefit analysis, *Nuclear powerplants, Social values, Decision making, Aesthetics, Measurement, Risks, Analytical techniques, Welfare(Economics), Economics, Land use, Optimum development plans.
Identifiers: *Environmental Impact Statements, *Criteria quantification, *Risk analysis.

Environmental Impact Statements give little guidance in selection and quantification of impacts and in the selection of a best alternative plan. At Battelle-Northwest, studies are being conducted of the societal valuation of environmental impacts in an attempt to provide additional data to decision makers. Eight impact criteria covering aesthetics, land use, health and safety, cultural, economic, water, air, and ecology are identified and dimension-less indices created for each. A norm is also created using preexisting conditions for comparison. Social phsychologists at at Battelle have been instrumental in attempts to develop societal value measures for each criterion. Efforts have been centered on the perfection of survey methods which best outline these criteria to the public and solicit their responses. From this survey, societal weights will be developed. The weights multiplied by the criteria indices provide decision makers with a composite measure useful in choosing the best alternative. In addition to the above criteria, the public should be allowed to value the risks involved with each alternative. A benefit/risk ratio is explained as a method of choosing among projects with potentials of societal risks. (See also W74-06107) (Schroeder-Wisconsin)
W74-06115

A FRAMEWORK FOR LOCAL PARTICIPATION AND DECISION-MAKING,
Oregon State Univ., Corvallis. Cooperative Extension Service.
J. R. Pease.
In: How Effective are Environmental Impact Statements., Oregon State Univ., Corvallis, Water Resources Research Institute Seminar WR 017.73, July 1973, p 75-85. 3 fig.

Descriptors: *Environmental effects, Social participation, Inter-agency cooperation, Decision making, Social values, *Oregon, *Local governments.
Identifiers: *Environmental Impact Statements, Evaluation criteria, Process model.

The Local Government Relations Division of Oregon and the University Extension Service have joined to devise a procedure to aid local communities in complying with existing and anticipated Environmental Impact Statement requirements, in an attempt to improve the quality of the statements and increase citizen participation in environmental decision-making. The existing impact statement process fails to define the environmental criteria to be measured. It also provides little indication of how to choose between alternative plans having differing environmental impacts or increase citizen participation. A three stage process is suggested to refine and improve existing tools used in the development of Environmental Impact Statements. The key to the process is increased local participation and improved data collection. Public participation is encouraged through the use of an ad hoc advisory committee composed of representatives from the planning commission, appropriate state and federal agencies, and interested citizens, having continuous input into the planning process. Open forums are also provided at planned intervals to alert the public to the impact of the proposed project. An Extension assessment staff will be developed to collect data and aid in environmental assessment. This increased information and participation should go far in improving the existing ills in the statement preparation process. (See also W74-06107) (Schroeder-Wisconsin)

A HIGH SPEED MICROPROGRAMMED SYSTEM FOR GENERATION AND ACQUISITION OF SIGNALS,
Yale Univ., New Haven, Conn. Becton Center.
J. G. Zornig, and J. F. McDonald.
The Review of Scientific Instruments, Vol 44, No 9, p 1217-1221, September 1973. 7 fig, 2 append.

Descriptors: *Computers, *Data processing, *Data storage and retrieval, Design criteria, Computer programs.
Identifiers: Analog-to-digital converters.

A high speed microprogrammed system has been constructed to perform the synthesis and recording of high frequency nonrepeating pulse signals. The system can drive an analog device with arbitrarily designed waveforms and record individual pulses from several sensors in return. The present design operates at frequencies up to 1.5 MHz and can accept pulse durations of up to 1600 samples. Accuracy is limited by the available ADC and computer word size and is presently 8 bits (0.3 percent). A primary advantage of the design is the reliance to the maximum extent on the hardware of a small general purpose computer. Very little more external hardware is required than the ADC, DAC, and multiplexer. Waveforms are read directly from and stored directly in the host computer core memory. This enables the maximum flexibility in the design of service programs for particular experiments. At present the system is used for an experiment in which a fast pulse input is to be adjusted adaptively in real time based on the measured outputs of a system. (Little-Battelle)

Descriptors: *Testing procedures, *Instrumentation, Equipment, Automatic control, Automation, Methodology.
Identifiers: *Pilot systems, *Digital control systems.

When the control engineer is faced with a problem of pilot system checkout, he should have certain basic tools to start with - a systematic approach and test instruments. This article presents a description of basic test instrumentation and an accepted testing procedure that consists of a gradual buildup of an operating system core by individually testing each subassembly. RESPONSE TIME OF HIGH-FREQUENCY OSCILLATOR-TYPE PROXIMITY DETECTORS,
M. Uemura, and K. Ueda.
Control Engineering, Vol 20, No 12, p 56-58, December 1973. 5 fig.

Descriptors: Physical properties, *Instrumentation.
Identifiers: *Response time, *Proximity detectors, *High frequency oscillators, Response frequency.

The response time of a high frequency oscillator-type proximity detector is difficult to define because it depends on physical properties of the object to be detected, the size of the object, and the distance of the object from the sensing head. The discussion presented shows how to properly utilize the theory behind the operation of this particular type of proximity detector. (Holoman-Battelle)

AUTOMATIC COLLECTION AND TRANSMISSION OF HYDROLOGICAL OBSERVATIONS.
World Meteorological Organization, Geneva(Switzerland).
Operational Hydrology Report No 2, (WMO No 337), 1973. 69 p, 10 fig, 18 ref, 2 append.

Descriptors: *Data collections, *Instrumentation, *Telemetry, *Hydrologic data, Automation, Data processing, Precipitation gages, Stream gages, Meteorological data.

The advantages and disadvantages of updating, modernizing and automating hydrologic data collection systems are discussed in the light of recent technological progress in automatic instrumentation and transmission systems. Detailed guidance is included concerning the choice of automatic instruments and types of installation for various climatic and geographical conditions. A description of basic systems of transmission of hydrological observations and guidance for their selection are followed by examples of operational automatic transmission systems for hydrologic purposes in various countries. Technical information on instruments of proven reliability is tabulated. (Knapp-USGS)

SNOW SURVEYS FROM EARTH SATELLITES--A TECHNICAL REVIEW OF METHODS.
World Meteorological Organization, Geneva (Switzerland).
Report No 19 (WMO No 353), 1973. 42 p, 13 fig, 2 tab, 30 ref, 3 append.

Descriptors: *Satellites(Artificial), *Remote sensing, *Snow surveys, Snow cover, Snowpacks, Aerial photography, Data collections, Data processing, *Reviews.

Background information on the satellite and sensor systems available for snow studies, and the various approaches or methods used by various countries, and the results obtained are described. The approaches used are grouped as follows: (1) direct optical-mechanical methods; (2) optical-electronic methods; and (3) automated-electronic methods. In nonmountainous terrain the accuracy in location of the snow line has been cited at plus or minus 20 km. Most verifying figures in mountainous areas are cited in terms of the elevation of the snow line. (Knapp-USGS)

PRELIMINARY DESIGN CRITERIA, PERFORMANCE AND LIMITATIONS OF AN AIRBORNE LASER BATHYMETRIC SYSTEM,
Sparcom, Inc., Alexandria, Va.
G. D. Hickman, and A. H. Ghovanlou.
Technical Report No 3, August 1973. 49 p, 21 fig, 7 tab, 3 ref. Contract N000-14-71C-0202.

Descriptors: *Remote sensing, *Bathymetry, Sounding, *Instrumentation, Depth, *Turbidity, Hydrography, *Design criteria, Measurement.
Identifiers: *Lasers.

Laboratory transmission and scattering measurements were made of a pulsed blue-green neon laser through waters of varying turbidity (0.07-2.0) to develop an empirical model for predicting the performance of an airborne laser bathymetric system. The maximum depth measuring capability was approximately 15 attenuation lengths for a laser system operating at 30 kw/peak pulse from an altitude of 500 meters. The optimum scan angle of the laser transmitter was approximately 20 deg while the scan rate for a laser pulsing at 100 pps was 0.8 seconds. (Knapp-USGS)

TOWARD RADSCAT MEASUREMENTS OVER THE SEA AND THEIR INTERPRETATION,
Kansas Univ./Center for Research, Inc., Lawrence. Space Technology Center.
J. P. Claassen, A. K. Fung, S. T. Wu, and H. L. Chan.
Available from NTIS Springfield, Va. 22151 as NASA CR-2328 Price $4.25 domestic; $6.75 foreign. National Aeronautics and Space Administration Contractor Report CR-2328, November 1973. 114 p, 48 fig, 10 tab, 65 ref. NASA Contract NAS 1-10048.

Descriptors: *Remote sensing, *Microwaves, Radar, Oceanography, Meteorology,

Waves(Water), Winds, Data collections, Meteorological data.

Sub-orbital observations by a composite radiometer- scatterometer sensor (RADSCAT) demonstrate the remote anemometric capability of the sensor over sea through various weather conditions. The large-scale fluctuations of the wind over the sea dictate the observational coverage required to correlate measurements with the mean surface wind speed. Various theoretical investigations were performed to establish a premise for the joint interpretation of the experiment data. The effects of clouds and rains on downward radiometric observations over the sea were computed. From this study a method of predicting atmospheric attenuation from joint observations was developed, and the emission and scattering characteristics of the sea were derived. (Knapp-USGS)

ERTS-1 APPLICATIONS IN HYDROLOGY AND WATER RESOURCES,
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
V. V. Salomonson, and A. Rango.
Journal of the American Water Works Association, Vol 66, No 3, p 168-172, March 1974. 6 fig, 25 ref.

Descriptors: *Data collections, *Satellites(Artificial), *Remote sensing, Monitoring, Mapping, Water resources, Hydrologic data, Snow cover, Floods, Glaciers, Terrain analysis, Telemetry.

After having been in orbit for less than one year, the Earth Resources Technology Satellite (ERTS-1) has shown that it provides applicable data for more effective monitoring and management of surface-water features over the globe. In addition the Data Collection System (DCS) is a reliable tool for gathering hydrologic data from remote regions. The data are applicable in the monitoring and mapping of physiography and land use in drainage basins, surface-water bodies including wetlands, snow cover, flood-inundated areas, and glaciers. In-situ information is also being collected and relayed via satellite to water-resources-management agencies. (Knapp-USGS)

Identifiers: *Computer analyses, Display, Limestone, Mapping, *Maps, *Pennsylvania, Remote sensing, Shale, *Soil survey, Southeastern, Spectral imagery.

Computer analyses of multispectral imagery collected from aircraft shows promise for reducing preparation time and increasing the accuracy of soil survey maps. The study area in southeastern Pennsylvania included soils formed from limestone, shale, sandstone, alluvium and local colluvium. Four study sites 8.5-30 ha in size were selected from a 72 km flightline. Surface reflectance properties of nonvegetated fields were classified using pattern recognition techniques. Computer printout maps showing areal distribution of soil spectral classes were compared with field conditions. Limestone, shale, sandstone, and local colluvial soils were separated with a high degree of accuracy. Erosion classes separated by spectral maps were comparable in location and extent to field observations. The feasibility of preparing computer display maps for potential use as soil mapping aids was demonstrated.--Copyright 1973, Biological Abstracts, Inc.

A COMPUTER-BASED TELECONTROL AND COMMUNICATIONS SYSTEM FOR A WATER SUPPLY NETWORK,
R. H. Burch, K. C. Marlow, G. S. Gibbs, and M. S. Jennions.
Water and Water Engineering, Vol 77, No 933, p 453-458, November 1973. 8 fig, 2 tab.

Descriptors: *Water supply, *Monitoring, *Telemetry, *Network design, *Data transmission, *Radio communication systems, Control systems, Digital computers, Networks, Data processing, Equipment, Water quality.
Identifiers: Minicomputers.

Presented are aspects of telemetric operations utilized by a water supply network in England. The telemetry and control system is based on the concept of a central master station which scans plant data from the remote outstations by means of time division multiplexing (TDM). Each input and output connected to the system is given a unique numerical address so that data from any point can be requested by the transmission of a binary-coded function-address word. All the outstations receive the request, but only the outstation that recognizes the address replies with a word, or several words of data corresponding to the selected analogue or digital inputs. The system operates, therefore, in the half-duplex mode. Remote controls are performed by interrupting the scanning sequence with coded control messages, and a system of revertive checking is used to provide maximum security. Communication is, in most cases, over UHF radio links. The master station radio scanner is permanently on, but the outstation radios are only keyed when data is requested. The basic word length for both request and reply words is 12 bits, chosen to provide compatibility with the digital computer, adequate capacity for addressing and sufficient resolution for digitized analogue values. The operation of the master station is normally controlled by a minicomputer having 12,288 words of 12-bit core storage and a 32,768 word fixed-head disc store. An operator's control panel and addressable K-cards for local plant inputs and outputs are connected to the computer via standard interfacing units. The telemetry master unit is directed by the computer but is able to carry on scanning inputs set up on a patch panel in the event of computer failure. (Holoman-Battelle)

'CONTROL BY VARIANCE' WITH THE PROBABILITY COMPUTER,
Anacon, Inc., Ashland, Mass.
R. M. Green, and G. E. Stackhouse.
Control Engineering, Vol 21, No 1, p 50-51, January 1974. 3 fig, 2 ref.

Descriptors: *Control, Instrumentation, Probability, Automatic control.
Identifiers: *Probability computers, *Process variables, Variance, Probability density, Limits.

The probability computer predicts the likelihood of a process variable exceeding its limit value. The probability computer uses its predictions to move the setpoint away from the limit value when the variable 'acts up.' The prabability computer can benefit from observing the departures of the variable from the time average (mean). Such departures afford the probability computer data with which to calculate variance which is a measure of how often and how far the variable strays beyond its limit value. From the variance, the probability computer computes P(X greater than or equal to Y), the probability that the variable X will exceed its limit value Y. The probability density curve of X is standard except for concentration on one side of the mean (time average) for the purpose of computing P(X greater than or equal to Y). Operation of the probability computer was checked by applying a signal from a process simulator. A series of sine waves of varying frequency and amplitude provided the process variable simulation for the computer to monitor. (Holoman-Battelle)

Descriptors: *Floods, *California, *Mapping, Flood plains, Flood forecasting, Tides, Planning.
Identifiers: *Flood mapping, *Flood-prone areas, *San Francisco(Calif).

Areas in the nine-county San Francisco Bay region that are subject to inundation by the 100-year flood are delineated on maps. In general, the flood plains studied include only those along streams whose watersheds are greater than 2 square miles. Areas contiguous to the ocean and bay that have a potential flood hazard associated with high tides are delineated with respect to the 100-year high tide. The maps are intended only to provide information for regional planning aimed at the judicious use or management of flood-plain lands, and to indicate areas of potential flood hazard. (Knapp-USGS)

INDEX OF SURFACE WATER STATIONS IN TEXAS, OCTOBER 1973.
Geological Survey, Austin, Tex.
Open-file report, October 1973. 24 p, 2 plate, 2 tab.

Descriptors: *Data collections, *Hydrologic data, *Gaging stations, *Texas, Stream gages, Sampling, Stage-discharge relations, Streamflow, Surface waters, Water quality, Floods, Reservoirs.

The U.S. Geological Survey's investigations of the water resources of Texas Water Development Board, Texas are conducted in cooperation with the Texas Highway Department, river authorities, cities, U.S. Corps of Engineers, Environmental Protection Agency, U.S. Soil Conservation Service, and others. This index shows the station number and name, type of record collected, and the office at which the basic data are permanently filed. A permanent numerical designation for gaging stations has been adopted on a nationwide basis; stations are numbered and listed in downstream order. As of October 1, 1973, 463 stream-gaging, 77 reservoir-content, 14 stage, 8 flood-profile partial-record, 98 low-flow partial record, 187 crest-stage partial-record, 35 tide-level, 11 periodic water-quality, 110 daily chemical-quality, 25 continuous-recording water-quality, 71 periodic chemical-quality, 127 periodic organic-quality, 83 pesticides, 9 sediment, 27 periodic sediment, 34 periodic biological, and 55 reservoir-inventory stations were in operation. In addition to streamflow information collected at the regular gaging stations and the partial-record stations, measurements of flow and water-quality data have been collected for specific purposes at various other locations in the State. Many of these measurements show the peak discharges for the greatest flood that has been known to occur at that site. Others show minimum flows or channel losses experienced in various stream reaches. (Knapp-USGS)

SUPPORT IN THE OVERALL DESIGN DEVELOPMENT OF A NATIONAL WATER DATA EXCHANGE (NAWDEX), EXECUTIVE SUMMARY,
PRC Systems Sciences Co., McLean, Va.
F. D. Mason.
Report R-1697, January 8, 1974. 14 p, 2 fig. USGS Contract 14-08-0001-13499.

Descriptors: *Data collections, *Information exchange, *Information retrieval, *Data storage and retrieval, *Hydrologic data, Data processing, Basic data collections.
Identifiers: National Water Data Exchange(NAWDEX).

Overall design development of a national water data exchange (NAWDEX) is described. A system design for NAWDEX was prepared based on previous efforts of the U. S. Geological Survey, internal expertise in water data systems, and the results of a national survey of the water data community. An implementation plan was also prepared which can be used to transform the recommended design into an operating entity. The NAWDEX design includes an organizational structure featuring a System Central with overall management responsibility linking together participants from throughout the water data community. Operationally, Systems Central would provide an index to water data and certain limited data services with the bulk of the actual data exchange being effected by member agencies. Nominal charges for data requests and services are recommended as is federal funding of all fiscal and routine operating costs. (Knapp-USGS)

GEOHYDROLOGY OF ATCHISON COUNTY, NORTHEASTERN KANSAS,
Geological Survey, Washington, D.C.
J. R. Ward.
For sale by U.S. Geological Survey, Washington, D.C. 20242. Price $1.25 per set. Hydrologic Investigations Atlas HA-467, 1973. 2 sheets, 1 tab, 13 ref.

Descriptors: *Hydrogeology, *Kansas, Groundwater, Water quality, Aquifer characteristics, *Hydrologic data, *Maps, Glacial drift.
Identifiers: *Atchison County(Kans).

Information is presented on the groundwater resources of Atchison County, Kansas. Bedrock of Late Pennsylvanian age is exposed throughout the county. Unconsolidated glacial drift, loess, deposits beneath terraces, and alluvium overlie the bedrock surface. Both topography and texture of the glacial drift exert a strong influence on recharge to and discharge from the aquifers. Discharge from the aquifers is primarily to streams that drain the county. Some discharge occurs from seeps and springs along valley walls and from wells. A few wells in the county flow continuously. The unconsolidated Pleistocene deposits are the best potential sources of groundwater in the county. The most favorable areas overlie buried valleys. Four areas exist where water flows at the surface due to artesian pressure. Wells are

completed in bedrock, glacial drift, and alluvial aquifers. A summary of the concentrations of selected dissolved mineral constituents is shown on the correlation of stratigraphy and water quality diagram. Most of the water is of the calcium bicarbonate type. Although hard, it generally can be softened by simple treatment. Dissolved-solids concentrations are generally high, but acceptable. The highest concentrations of dissolved solids are in water from thick glacial deposits. (Knapp-USGS)

BUFFALO HARBOR, NEW YORK (MAINTENANCE), (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District. Buffalo, N.Y.
Avail. from Nat. Tech. Info. Serv., Springfield, Va. 22151, as EIS-NY-73-0100-F, for $3.00 paper copy, $1.45 microfiche. May 26, 1972. 34 p, 2 map.

Descriptors: *New York, *Harbors, *Lake Erie, *Breakwaters, Channels, Dredging, Maintenance, Piers, Pollutants, Channelization, Environmental effects, Trubidity.
Identifiers: *Environmental Impact Statements.

The work under consideration is the recurring maintenance of completed channels and structures in the deep-draft navigation project for Buffalo Harbor, New York. Project features are depicted on a map. They include a breakwater system, a pier, and dredged areas in entrance channels. Maintenance consists of dredging as necessary to maintain authorized depths, and of repairs to structures. Environmental impacts include dredging of 525,000 cubic yards of sediment annually, about one-third being placed in an inclosed disposal area and the less polluted remainder in Lake Erie. Adverse environmental effects include temporary turbidity in dredging and open-water spoil areas and addition to Lake Erie of pollutants contained in dredged material. Alternatives include discontinuance of maintenance and provision of inclosed areas for all spoil. (Sears-Florida)

A COMPUTER PROGRAM FOR EARTHQUAKE ANALYSIS OF GRAVITY DAMS INCLUDING HYDRODYNAMIC INTERACTION,
California Univ., Berkeley. Earthquake Engineering Research Center.
P. Chakrabarti, and A. K. Chopra.
Available from NTIS Springfield, Va 22151 AD-766 271 Price $3.00 printed copy; $1.45 microfiche. Report No 73-7, May 1973. 56 p, 8 fig, 14 ref, append. Army Contract DACW73-71-C-0051.

Descriptors: *Earthquakes, *Dams, *Computer programs, *Simulation analysis, Finite element analysis, Earthquake engineering, Seismic design, *Gravity dams.

A computer program for earthquake analysis of gravity dams includes effects of hydrodynamic interaction. The dam-water system is idealized as two-dimensional in geometry, the material behavior is assumed to be linearly elastic, and the transverse horizontal as well as the vertical component of ground motion are considered. The dam is represented as a finite element system, whereas water in the reservoir is treated as a continuum of infinite length in the upstream direction, governed by the wave equation. Compressibility of water is considered; this results in governing equations for the dam depending on the excitation frequency. The analysis is performed in the frequency domain, by first obtaining the frequency responses and then using a Fourier synthesis. A listing of the computer program is included and the usage and capabilities are illustrated. (Knapp-USGS)
W74-06280

EARTHQUAKE RESPONSE OF GRAVITY DAMS INCLUDING RESERVOIR INTERACTION EFFECTS,
California Univ., Berkeley. Earthquake Engineering Research Center.
P. Chakrabarti, and A. K. Chopra.
Available from NTIS, Springfield, Va. 22151 as AD-762 330 Price $6.00 printed copy; $1.45 microfiche. Report No EERC 72-6, December 1972. 164 p, 53 fig, 4 tab, 38 ref.

Descriptors: *Gravity dams, *Earthquakes, *Earthquake engineering, *Seismic design, *Dam design, *Earth dams, Mathematical models, Dam failure, Finite element analysis, Seiches, Waves(Water).

A procedure was developed for earthquake analysis of gravity dams including effects of reservoir interaction. The analysis includes the influence of the reservoir on the response of the structure. The problem of transverse vibration of a monolith of the dam is reduced to one in two dimensions. The material behavior is assumed to be linearly elastic. The dam is represented as a finite element system and the reservoir is treated as a continuum governed by the wave equation. The reservoir causes a significant increase in the resonant periods on the dam. This lengthening of the resonant periods depends upon the depth of the reservoir and the modulus of elasticity of the dam. It is negligible for reservoir depths less than approximately 40% of the dam height and increases with the modulus of elasticity of the dam. Analyses considering only the fundamental mode of vibration are capable of predicting reasonably accurately the maximum displacements of the dam with reservoir interaction. The presence of the reservoir causes a significant increase in the lateral displacement of the dam which is not always accompanied by an increase in the stresses in all parts of the dam. For typical California ground motions reservoir interaction causes increases in stresses in almost direct proportion to the additional displacements. The response of the dam alone to vertical components of ground motion is small relative to that due to the horizontal component of ground motion, but vertical response becomes very significant when reservoir interaction effects are included. For low height dams the response to the vertical component of ground motion may even exceed that due to the horizontal component. (Knapp-USGS)
W74-06359

8B. Hydraulics

MODEL AND PROTOTYPE ANALYSIS OF THE OLD RIVER DIVERSION ON THE MISSISSIPPI RIVER,
Army Engineer District. Vicksburg, Miss. Potamology Section.
P. C. Harris, and W. R. Posey.
Available from the National Technical Information Service as PB-230 433, $4.50 in paper copy, $1.45 in microfiche. Mississippi State University Water Resources Research Institute State College Publication, 1973. 22 p, 12 fig, 2 tab, 6 ref. OWRR A-999-MISS (9c).

Descriptors: *Hydraulic models, *Mississippi River, *River training, Sedimentation, Cutoffs, Dikes, *Diversion dams, *Control structures.
Identifiers: Atchafalaya River, Old River.

In order to prevent the capture of the Mississippi River by the Atchafalaya River, two control structures were built on the west bank of the Mississippi River approximately 10 miles upstream from Old River. A side draft developed at the entrance to the low sill control structure tending to pull tows toward the structure. A model of the reach was constructed at Waterways Experiment Station to develop a plan to improve the situation. The plan for improving the condition was to develop the pool along the left bank with the crossing near the entrance to the structure stabilizing the channel into its former alignment. The results of the model tests were that the dike field filled and the bar on the opposite side receded. By keeping the dike profiles low and sloping, scour around the dikes may be held to a minimum. This type of design allows the river to adjust slowly to a dike field rather than fight it. (Knapp-USGS)

HYDRAULICS AND SEDIMENTARY STABILITY OF COASTAL INLETS,
Florida Univ., Gainesville. Coastal and Oceanographic Engineering Lab.
M. P. O'Brien, and R. G. Dean.

Available from NTIS as COM 73-11916 for $3.75 in paper copy. In: Proceedings of 13th Conference on Coastal Engineering held Vancouver, B.C., Canada, July 10-14, 1972. ASCE, Chap 41, p 761-780, 1972. 14 fig, 13 ref.

Descriptors: *Inlets(Waterways), *Deposition, Hydraulics, Stability, Florida, New York.
Identifiers: Stability indices.

A method is presentd for investigating the stability of coastal inlets against closure due to transport and deposition of sand in the inlet cross-section. The method utilizes earlier contributions by: (1) Keulegan representing the hydraulics of inlets, (2) O'Brien which describes an equilibrium relationship between the cross-sectional area of the inlet and the bay tidal prism, and (3) Escoffier which relates to the stability of an inlet under changes in conditions which tend to close or enlarge an inlet. A 'stability index' is defined which incorporates the buffer storage area available in the inlet cross-section, prior to the onset of closure and also includes the capability of the inlet to transport excess sand from its cross-section. In order to apply the method, geometric and hydraulic data representing the inlet are necessary; the minimum data required include a survey of the inlet throat cross-section and the lag between high (or low) water in the ocean and the following slack water in the inlet. In addition, it is necessary to conduct measurements or make assumptions concerning the minor and gradual hydraulic loss coefficients. Based on assumed depositional patterns in the inlet, the method is applied to five real inlets and the stability indices are presented. (Sinha - OEIS)

INFLUENCE OF APPEARANCE OF PREY AND SATIATION OF PREDATOR ON FOOD SELECTION BY NORTHERN PIKE (ESSOX LUCIUS),
Wisconsin Cooperative Fishery Unit, Stevens Point.
D. W. Coble.
J Fish Res Board Can. Vol 30, No 2, p 317-320, 1973.
Identifiers: Bluegill, Carassius-auratus, Carp, Cyprinus-carpio, Esox-lucius, Fathead minnows, Food, *Goldfish, Lepomis-cyanellus, Lepomis-macrochirus, *Pikes(Northern), Pimephales-promelas, *Predator-prey relationship, Sunfish.

Northern pike (E. lucius) were put in tanks with fantail and regular-tail goldfish (Carassius auratus) or with goldfish of different colors. Physical appearance of prey did not affect the pike's feeding. In experiments in plastic pools 4 spp. of fish were exposed to predation by northern pike that were satiated or deprived of food for either 2 or 4 wk. The pike always selected carp (Cyprinus carpio) and fathead minnow (Pimephales promelas) over green sunfish (Lepomis cyanellus) and bluegill (L. macrochirus).--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF STARVATION AND SUBSEQUENT FEEDING ON SURVIVAL AND GROWTH OF FULTON CHANNEL SOCKEYE SALMON FRY (ONCORHYNCHUS NERKA),
Fisheries Research Board of Canada, Nanaimo (British Columbia). Biological Station.
H. T. Bilton, and G. L. Robins.
J Fish Res Board Can. Vol 30, No 1, p 1-5. 1973. Illus.
Identifiers: *Canada(Fulton River), Channels, Feeding, Fry, Growth stages, Oncorhynchus-nerka, *Sockeye salmon, Survival, Fish mortality, *Salmon starvation.

In the laboratory 8 groups of Fulton River (Canada) channel fry were starved for periods ranging from 1 to 7 wk, then offered food ad libitum for 8 wk. Fry withstood up to 4-wk starvation with less than 10% mortality; beyond this point mortality increased sharply to 90% at 7-wk starvation. At 5-wk starvation both fry length and weight decreased significantly. Mortality continued when fish were offered food ad libitum after being starved. Among fish starved for 1 and 2 wk, mortalities continued to be low, 0 and 6.6%, respectively; but among fish starved from 3 to 5 wk, mortalities rose considerably, ranging from 42-99%.--Copyright 1973, Biological Abstracts, Inc.

Productivity of Individual Varieties of Grain Cultures in Connection with Characteristics of Water Regime in Non-Irrigated Areas, (In Russian),
W74-06139 3F

Characteristic Changes in Water Forms in Cereal Type, Leaves Cultivated Without Irrigation, (In Azerbaijan),
W74-06233 3F

BASALTS
Hydrology of Basalt Aquifers and Depletion of Ground Water in East-Central Washington,
W74-06311 2F

BASE FLOW
Subsurface Component of the Hydrologic Budget of the Caspian Sea (O podzemnoy sostavlyayushchey vodnogo balansa Kaspiyskogo morya),
W74-06449 2F

BASELINE STUDIES
Trace Metals in the North Sea,
W74-06011 5A

BATHYMETRY
Preliminary Design Criteria, Performance and Limitations of an Airborne Laser Bathymetric System,
W74-06296 7B

BAY OF FUNDY
Preliminary Investigations of an Intertidal Sand Body, Cobequid Bay, Bay of Fundy,
W74-06260 2L

BAYER 73
Acute Toxicities of Antimycin A, Bayer 73, and TFM to the Ostracod Cypretta Kawatai,
W74-06039 5C

BAYOU TEXA (FLA)
Nutrient-Productivity Relationships in a Bayou Estuary,
W74-06160 5C

BDELLOVIBRIO BACTERIOVORUS
Occurrence of Phosphonosphingolipids in Bdellovibrio Bacteriovorus Strain UKi2,
W74-06097 5A

BEACH CUSPS
Origin and Development of Beach Cusps at Monterey Bay, California,
W74-06313 2J

BEACH EROSION
Detrital Quartz as a Natural Tracer-Fourier Grain Shape Analysis,
W74-06293 2J

BEACHES
A Bill to Amend the Act of August 3, 1968, Relating to the Nation's Estuaries and Their Natural Resources, to Establish a National Policy with Respect to the Nation's Beach Resources.
W74-06177 6E

A Bill to Declare a National Policy that the Beaches of the United States are Impressed with a National Interest and that the Public Shall have Free and Unrestricted Right to Use Them.
W74-06213 6E

Beach Foreshore Sedimentology and Morphology in the Apostle Islands of Northern Wisconsin,
W74-06281 2J

Origin and Development of Beach Cusps at Monterey Bay, California,
W74-06313 2J

BEANS (PINTO)
Salinity-Ozone Interactive Effects on Yield and Water Relations of Pinto Bean,
W74-06070 3C

BEAVER FOOD
Water Lilies as Beaver Food.
W74-06490 2H

BELLMER DEWATERING PRESS
Bellmer Converging Double-Belt Press, An Interesting Machine for Sludge Dewatering (Die Bellmer-Winkelpresse, ein interessantes Geraet fuer die Schlammentwaesserung).
W74-06386 5D

BELUGA WHALES
Occurrence of DDT Residues in Beluga Whales (Delphinapterus Leucas) From the Mackenzie Delta, N.W.T.,
W74-06061 5A

BENTHIC FAUNA
The Acute Toxicity of Some Heavy Metal Ions toward Benthic Organisms,
W74-06035 5C

Benthic Fauna and Zooplankton in Some Polluted Swedish Estuaries,
W74-06043 5C

BENTHIC FLORA
Effects of Thermal Additions from the Yellowstone Geyser Basins on the Benthic Algae of the Firehole River.
W74-06046 5C

BERMUDA (MANGROVE LAKE)
Trace Metals in Carbonate and Organic Rich Sediments,
W74-06050 5A

BERYLLIUM SULFATE
Effect of Water Hardness on the Tolerance of the Guppy to Beryllium Sulfate,
W74-06034 5C

BETULA-VERRUCOSA
Effect of Water Deficiency and Light Regime on Photosynthetic Activity of Leaves, (In Russian),
W74-06246 2I

BIBLIOGRAPHIES
Applicability of Programming Models to Pricing and Risk Control in Water Resource Management,
W74-06104 6A

BICARBONATES
Changes in Periphytic Algae Following Bicarbonate Additions to a Small Stream,
W74-06087 5C

BIOACCUMULATION
Endrin Uptake and Release by Fingerling Channel Catfish (Ictalurus Punctatus),
W74-06060 5C

Distribution of Dieldrin in the Turtle,
W74-06124 5A

BIOASSAY
Uptake and Accumulation of an Organochlorine Insecticide (Dieldrin) by an Estuarine Mollusc, Rangia Cuneata,
W74-06031 5C

Mirex Incorporation in the Environment: Toxicity in Selected Freshwater Organisms,
W74-06032 5C

BORDER-STRIP IRRIGATION
Physical Model Study of Border-Strip Irrigation,
W74-06340 3F

BOREHOLE GEOPHYSICS
Geophysical Investigations of Washington's Ground Water Resources,
W74-06262 2F

BOTTOM SEDIMENTS
Transfer of Heavy Metal Pollutants from Lake Erie Bottom Sediments to the Overlying Water,
W74-05956 5B

Trace Metals in Sediments of New York Bight,
W74-06012 5A

Trace Metals in Carbonate and Organic Rich Sediments,
W74-06050 5A

Accumulation and Movement of Mirex in Selected Estuaries of South Carolina, 1969-71,
W74-06054 5B

Factors Affecting the Behavior of Five Chlorinated Hydrocarbons in Two Natural Waters and Their Sediments,
W74-06064 5B

Benthic Oxygen Demands of Houston Ship Channel Sediments,
W74-06073 5C

The Possible Occurrence of Photosynthetic Microorganisms in Deep-Sea Sediments of the North Atlantic,
W74-06155 5B

Determination of Montmorillonite in Small Samples and Implications for Suspended-Matter Studies,
W74-06285 2J

The Ionium-Thorium Method of Determination of Absolute Age and Rate of Deposition of Bottom Sediments (K voprosu opredeleniya absolyutnogo vozrasta i skorosti sedimentatsii donnykh otlozheniy ioniy-toriyevym metodom),
W74-06308 2J

BOTULISM
Inability to Detect Spores of Clostridium Botulinum in Fish Protein Concentrates (FPC),
W74-06058 5A

BOUNDARY CONDITIONS
The Computation of Tides and Currents in Estuaries and Canals: Appendix A: A User's Manual,
W74-06312 2L

BREAKWATERS
Buffalo Harbor, New York (Maintenance), (Final Environmental Impact Statement).
W74-06197 8A

BRINES
The Effects of Restricted Circulation on the Salt Balance of Great Salt Lake, Utah,
W74-06435 2H

BROOK TROUT
Captain Toxicity to Fathead Minnows (Pimephales Promelas), Bluegills (Lepomis Macrochirus), and Brook Trout (Salvelinus Fontinalis),
W74-06085 5C

Biological Effects of Fenitrothion in the Diet of Brook Trout,
W74-06169 5C

BUDGETING
Proposed Big Cypress Reserve, Florida.
W74-06005 6E

BURLEIGH CO
Burnt Creek RC and D Measure for Flood Prevention (Final Environmental Statement).
W74-06002 4A

CADMIUM
Physiological Response of the Mud Crab, Eurypanopeus Depressus to Cadmium,
W74-06126 5C

CALIBRATIONS
A Calibration of Instruments with Non-Random Errors,
W74-06026 7B

CALIFORNIA
Oppen V. Aetna Insurance Co. (Action for Damages to Pleasure Boats Resulting from Oil Spill Disaster).
W74-06181 6E

Flood Prone Areas in the San Francisco Bay Region, California,
W74-06275 7C

Preliminary Investigations of an Intertidal Sand Body, Cobequid Bay, Bay of Fundy,
W74-06260 2L

Observed Changes in Groundwater Regime Caused by the Creation of Lake Diefenbaker, Saskatchewan,
W74-06291 2F

River Basin Planning and the Forest Industry--Compromise or Conflict,
W74-06398 6B

Color Removal Process.
W74-06399 5D

An Approach to Evaluation in Multiple Objective River Basin Planning, An Analysis of Selected Water Quantity Alternatives in the Okanagan Valley, British Columbia, Canada,
W74-06425 6A

CANADA (CHAR LAKE-N
Growth , Life History, and Respiration of Mysis relicta in an Arctic and Temperate Lake,
W74-06500 2H

CANADA (ELLIOTT LAKE)
New Complexities in Zoogeography and Taxonomy of the Pygmy Whitefish (Prosopium coulteri),
W74-06498 2H

CANADA (FULTON RIVER)
Effects of Starvation and Subsequent Feeding on Survival and Growth of Fulton Channel Sockeye Salmon Fry (Oncorhynchus nerka),
W74-06119 8I

CANADA (NEWFOUNDLAND)
Water Lilies as Beaver Food.
W74-06490 2H

CANADA (PEACE RIVER)
Ferruginous Concretions in a Poorly Drained Soil of Alberta,
W74-06485 2G

CANALS
A Bill to Amend the Project for Flood Protection on Indian Bend Wash, Maricopa County, Arizona, Authorized by the Flood Control Act of 1965.
W74-06178 6E

The Computation of Tides and Currents in Estuaries and Canals: Appendix A: A User's Manual,
W74-06312 2L

CAPTAIN
Captain Toxicity to Fathead Minnows (Pimephales Promelas), Bluegills (Lepomis Macrochirus), and Brook Trout (Salvelinus Fontinalis),
W74-06085 5C

CARBAMATE PESTICIDES
Electron Donor-Acceptor Reagents in the Analysis of Pesticides. VII. A Simple Model System Hydrolysis of Some Carbamate Pesticides,
W74-06121 5B

CARBARYL
Metabolism of Selected Pesticides by Marine Microorganisms,
W74-06066 5C

CARBON
Nitrogen and Phosphorus Release from Decaying Water Milfoil,
W74-06018 5C

Response of Anabaena to pH, Carbon, and Phosphorus,
W74-06165 5C

Carbon and Nitrogen as Regulators of Algal Growth,
W74-06166 5C

An Inexpensive Titration Method for the Determination of Organic Carbon in Recent Sediments,
W74-06284 5A

CARBON-14 TECHNIQUES
Preliminary Results of Studies About the Plankton of the 'Laguna Setubal' (Santa Fe, Argentina), (In Spanish),
W74-06238 2H

CARBONATES
Changes in Periphytic Algae Following Bicarbonate Additions to a Small Stream,
W74-06087 5C

CARIBBEAN SEA
On the Origin of the Dry Climate in Northern South America and the Southern Caribbean,
W74-06470 2B

CENTRIFUGATION
Dewatering of Biological-Chemical Paper Mill Waste Water Sludge with the 'System Hiller' KHD Centrifuge (Entwaesserung von biologisch-chemischem Papierfabriksabwasser-Schlamm mit der KHD-Zentrifuge 'System Hiller'),
W74-06392 5D

CERTIFICATION
Water and Sewer System Regulatory Law.
W74-06224 6E

CESIUM
Relationships Between Levels of Radiocesium in Dominant Plants and Arthropods in a Contaminated Streambed Community,
W74-06016 5C

CHAINING
Soil Moisture Patterns on Two Chained Pinyon-Juniper Sites in Utah,
W74-06459 2G

Runoff and Sediment Yields from Runoff Plots on Chained Pinyon-Juniper Sites in Utah,
W74-06460 2J

CHAMBERS (FLOW-SPLITTING)
A Simplified Flow-Splitting Chamber and Siphon for Proportional Diluters,
W74-06094 7B

CHANNEL CATFISH
The Influence of Dissolved Oxygen on the Growth of Channel Catfish,
W74-06038 5C

Endrin Uptake and Release by Fingerling Channel Catfish (Ictalurus Punctatus),
W74-06060 5C

CHANNEL FLOW
River Improvement.
W74-06200 6E

CHANNEL IMPROVEMENT
River Improvement.
W74-06200 6E

CHAR LAKE (N
Oxygen Consumption of Limnocalanus Macrurus Sars (Calanoida, Copepoda) in Relation to Environmental Conditions,
W74-06029 5C

CHELATING AGENTS
Mobilization of Some Metals in Water and Animal Tissue by NTA, EDTA and TPP,
W74-06173 5B

CHELATION
Effect of Chelation on Toxicity of Copper,
W74-06048 5C

CHEMCONTROL
Soil Moisture Response to Spraying Big Sagebrush the Year of Treatment,
W74-06462 2I

CHEMICAL ANALYSIS
Arsenic and Antimony in Laundry Aids by Instrumental Neutron Activation Analysis,
W74-06030 5A

Mycological Applications of X-Ray Microanalysis,
W74-06096 5A

Occurrence of Phosphonosphingolipids in Bdellovibrio Bacteriovorus Strain UKi2,
W74-06097 5A

Electron Donor-Acceptor Reagents in the Analysis of Pesticides. VII. A Simple Model System Hydrolysis of Some Carbamate Pesticides,
W74-06121 5B

Distribution of Dieldrin in the Turtle,
W74-06124 5A

Herbicide Analysis by Pulse Polarography-Ficloram,
W74-06127 5A

Determination of Residues of Mesurol and its Toxic Metabolites in Plant and Animal Tissues,
W74-06128 5A

Determination of Phthalates in Biological Samples,
W74-06129 5A

Pesticides in Effluents and Polluted River Water,
W74-06130 5A

The Determination of Trace Transition Elements in Biological Tissues Using Flameless Atom Reservoir Atomic Absorption,
W74-06132 5A

Trace Metals Analysis on Small Oil Samples,
W74-06142 5A

Pollution Analyzers for Air and Water-Who makes What,
W74-06153 5A

Properties of GB in Water,
W74-06161 5B

Loss of Mercury(II) from Solution,
W74-06266 5B

CHEMICAL OXYGEN DEMAND
Rapid Determination of Chemical Oxygen Demand in Waste Waters of Wood-Chemical Factories (Uskorennoe opredelenie KhPK stochnykh vod ashinskogo lesokhimicheskogo kombinata),
W74-06406 5A

CHEMICAL PRECIPITATION
Characterisation and Magnetic Properties of Natural Ferric Gel,
W74-05992 2K

CHEMICAL REACTIONS
Chemiluminescence Analysis for Trace Pollutants,
W74-06131 5A

CHEMILUMINESCENCE
Chemiluminescence Analysis for Trace Pollutants,
W74-06131 5A

CHERNOZEMS
Effects of a Genetic Soil Group on Runoff (Vliyaniye geneticheskogo tipa pochvy na stok),
W74-06304 2G

CHESAPEAKE BAY
Surface Observations, Ground Truth and Data, NASA-USGS Mission 144, Chesapeake Bay Region, Sept. 22-30, 1970,
W74-06300 5A

Nutrient Enrichment and Control Requirements in the Upper Chesapeake Bay, Summary and Conclusions,
W74-06352 5C

CHESTNUT SOILS
Effects of a Genetic Soil Group on Runoff (Vliyaniye geneticheskogo tipa pochvy na stok),
W74-06304 2G

Moistening of Mountain Light-Chestnut Soils of Extracontinental Regions of Tien-Shan and Altai Mountains, (In Russian),
W74-06341 2G

CHEYENNE (WYO)
Summary of Water-Level and Pumpage Data in the Cheyenne and Federal Municipal Well Fields, April 1, 1972 to April 2, 1973, Cheyenne, Wyoming,
W74-06369 4B

CHILE
The Coastal Desert of Chile,
W74-06473 2B

Climatic Profile of the North Chilean Desert at Latitude 20 Degrees South,
W74-06475 2B

New Directions in the Chilean North,
W74-06476 3B

The Plio-Quaternary Climatic Changes Along the Semiarid Seaboard of Chile,
W74-06478 2B

CHILE (IQUIQUE)
The Fish-Meal Industry of Iquique,
W74-06477 3F

CHINESE MITTEN CRAB
First Records of the Chinese Mitten Crab, Eriocheir Sinensis, (Crustacea:Brachyura) From North America,
W74-06171 2I

CHIRONOMUS
Effects of Acid Mine Drainage on the Stream Ecosystem of the East Fork of the Obey River, Tennessee,
W74-06491 5C

CHLORIDES
Studies with Dithizone. Part XXX. Complexes of Metals, with S-Methyldithizone and the Methylation of Metal Dithizonates,
W74-06122 5A

Consumption of Water by the Cotton Plant at Different Concentrations of Soil Solution, (In Russian),
W74-06236 3C

CHLORINATED HYDROCARBON PESTICIDES
Pesticide Residues in Natural Fish Populations of the Smoky Hill River of Western Kansas - 1967-69, 10H. E. Klaassen, and
W74-06052 5A

International Cooperative Study of Organochlorine and Mercury Residues in Wildlife, 1969-71,
W74-06053 5A

Pesticides in Selected Western Streams - 1968-71,
W74-06062 5A

Herbicide Analysis by Pulse Polarography-Ficloram,
W74-06127 5A

Pesticides in Effluents and Polluted River Water,
W74-06130 5A

CHLORINATED HYDROCARBONS
Factors Affecting the Behavior of Five Chlorinated Hydrocarbons in Two Natural Waters and Their Sediments,
W74-06064 5B

CHLORINATION
Physical-Chemical Nitrogen Removal from Municipal Wastewater,
W74-06355 5D

The Anti-Pollution Sequence - A New Route to Reduced Pollutants in Bleach Plant Effluent,
W74-06385 5D

CHLORINE
Evaluation of Existing Field Test Kits for Determining Free Chlorine Residuals in Aqueous Solutions,
W74-06162 5A

CHLORODIBENZOFURANS
Photodecomposition of Chlorinated Biphenyls and Dibenzofurans,
W74-06125 5B

CHRISTIANSTED HARBOR (VI)
Environment, Water and Sediments of Christiansted Harbor, St. Croix,
W74-06292 5C

CHROMATES
Temperature and the Toxicity of Chromate and Arsenate to the Rotifer, Philodina Roseola,
W74-06172 5C

CHROMATOGRAPHY
Determination of Ametrine and Atrazine Residues in Soil by Thin-Layer Chromatography,
W74-06024 5A

Detection of Organophosphorous Pesticides by in Situ Fluorometry on Thin-Layer Chromatograms,
W74-06025 5A

Lipopolysaccharide and Proteins of the Cell Envelope of Vibrio Marinus, A Marine Bacterium,
W74-06028 5A

Thin-Layer Chromatographic Analysis of HMX in Water,
W74-06033 5A

Occurrence of Phosphonosphingolipids in Bdellovibrio Bacteriovorus Strain UKi2,
W74-06097 5A

Electron Donor-Acceptor Reagents in the Analysis of Pesticides. VII. A Simple Model System Hydrolysis of Some Carbamate Pesticides,
W74-06121 5B

Chromatographic Determination of Dihydric Phenols in Waste Water (Stanoveni Obsahu dvojmocnych fenolu v odpadnich vodach pomoci chromatografie),
W74-06396 5A

CHROMIUM
Transfer of Heavy Metal Pollutants from Lake Erie Bottom Sediments to the Overlying Water,
W74-05956 5B

CHROMOGENIC REAGENTS
The Determination of Tannin and Lignin,
W74-06163 5A

CIBOLO PROJECT (TEX)
Cibolo Project, Texas.
W74-06004 6E

CIONA-INTESTINALIS
Spawning, Larval Settlement, Growth, Biomass, and Distribution of Ciona intestinalis L. (Tunicata) in Borgenfjorden, North-Trondelag, Norway,
W74-06417 2L

CLAYS
A Re-Examination of the Use of the Silt/Clay Ratios as Indicators of Sedimentary Environments: A Study for Students,
W74-05989 2J

CLEAR-CUTTING
A Literature Review of Timber-Harvesting Effects on Stream Temperatures: Research Needs for the Southwest,
W74-06437 4C

CLIMATIC DATA
Dendroclimatic History of Southwestern United States,
W74-06290 2B

Mean Precipitation-Hours for the Conterminous United States,
W74-06390 2B

New Evidence on the Climatic Controls Along the Peruvian Coasts,
W74-06471 6B

CLIMATIC ZONES
Climatic-Geomorphological Zones and Land Utilization in the Coastal Deserts of the North Sahara,
W74-06480 4A

CLIMATOLOGY
Mean Precipitation-Hours for the Conterminous United States,
W74-06390 2B

The Plio-Quaternary Climatic Changes Along the Semiarid Seaboard of Chile,
W74-06478 2B

CLOSTRIDIUM BOTULINUM
Inability to Detect Spores of Clostridium Botulinum in Fish Protein Concentrates (FPC),
W74-06058 5A

CLOUD SEEDING
Impacts of Induced Rainfall on the Great Plains of Montana.
W74-06442 3B

CRABS
First Records of the Chinese Mitten Crab, Eriocheir Sinensis, (Crustacea:Brachyura) From North America,
W74-06171 2I

CRASSOSTREA-RHIZOPHORAE
A Parasitic Sporozoan of Crassostrea rhizophorae (Guilding), (In French),
W74-06253 5C

CRAYFISH
Cambarus Buntingi, A New Species of Puncticambarus (Decapoda, Astacidae) from Kentucky and Tennessee,
W74-06056 2I

CRITERIA QUANTIFICATION
Tomorrow's Environmental Benefit-Cost Analysis,
W74-06115 6G

CROP PRODUCTION
Interactive Effects of Salinity and Ozone on Growth and Yield of Garden Beet,
W74-06342 3C

Agricultural Impacts,
W74-06445 3B

CROP YIELD
Salinity-Ozone Interactive Effects on Yield and Water Relations of Pinto Bean,
W74-06070 3C

CRUSTACEANS
The Biology of Mysids Acclimatized in the Reservoirs of the Volga River,
W74-06017 2H

The Biology of Gammarus (Crustacea, Amphipoda) in the Northwestern Atlantic, VII. The Duration of Embryonic Development in Five Species at Various Temperatures,
W74-06120 5C

First Records of the Chinese Mitten Crab, Eriocheir Sinensis, (Crustacea:Brachyura) From North America,
W74-06171 2I

Observations on Water Fleas (Cladocera) in the Trout Pools at the Biological Station Lunz (Lower Austria),
W74-06248 2H

Estimating Accuracy for Calculating Production and Elimination of Planktonic Crustaceans Using Eudiaptomus gracilis in Lake Krasavitsa as an Example, (In Russian),
W74-06249 2H

CRYSTAL LAKE (PENN)
Some Characteristics of an Oscillatoria-Dominated Metalimnetic Phytoplankton Community,
W74-06081 5C

CUI-UI LAKESUCKER
Reproductive Characteristics of the Cui-ui Lakesucker (Chasmistes cujus Cope) and Its Spawning Behavior in Pyramid Lake, Nevada,
W74-05999 2H

CULTIVATION
Nitrogen and Phosphorus Composition of Surface Runoff as Affected by Tillage Method,
W74-06344 5B

CULTURE MEDIA
Coliform Counts of Polluted Waters: A Comparison of Media and Methods,
W74-06093 5A

Evaluation of Malonate Dulcitol Lysine Iron Agar for Presumptive Identification of Salmonellae,
W74-06150 5A

CULTURES
The Heterotrophic Capabilities of Cyclotella Meneghiniana,
W74-06090 5C

Interactions Between DDT and River Fungi. II. Influence of Culture Conditions on the Compatibility of Fungi and p,p'-DDT,
W74-06123 5C

A Simple Turbidimeter for Rapid Determination of Low Bacteria Concentrations,
W74-06147 5A

CURRENTS (WATER)
Water Exchange in Lake Baykal (O vodoobmene v oz. Baykal),
W74-06306 2H

CUSP FORMATION
Origin and Development of Beach Cusps at Monterey Bay, California,
W74-06313 2J

CUTTING MANAGEMENT
A Literature Review of Timber-Harvesting Effects on Stream Temperatures: Research Needs for the Southwest,
W74-06437 4C

CYANIDES
Airtex Products, Inc. V. Pollution Control Board (An Appeal from an Agency Imposed Fine for Discharge of Cyanides into Sewer System).
W74-06323 6E

Mine Water Purification by Reverse Osmosis,
W74-06409 5D

CYANOPHYTA
The Effect of Stress and Non-Stress Conditions Upon the Interaction of Plectonema boryanum and the LPP-Phycoviruses,
W74-05960 5C

Algal Assays of Archipelago Waters. Quantitative Aspects,
W74-06015 5C

Some Characteristics of an Oscillatoria-Dominated Metalimnetic Phytoplankton Community,
W74-06081 5C

CYTOLOGICAL STUDIES
Lipopolysaccharide and Proteins of the Cell Envelope of Vibrio Marinus, A Marine Bacterium,
W74-06028 5A

DALLAS (TEX)
Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Dallas, Texas Metropolitan Area, 1971,
W74-06288 2A

DAM DESIGN
Earthquake Response of Gravity Dams Including Reservoir Interaction Effects,
W74-06359 8A

DAMS
A Computer Program for Earthquake Analysis of Gravity Dams Including Hydrodynamic Interaction,
W74-06280 8A

DAPHNIA AMBIGUA
Population Dynamics of Pond Zooplankton. II. Daphnia Ambigua Scourfield,
W74-06154 5C

DARTERS (BLACK-BANDED)
Food Habits and Feeding Chronology of the Blackbanded Darter, Percina nigrofasciata (Agassiz), in Halawakee Creek, Alabama,
W74-06493 2I

DATA COLLECTIONS
Pesticides in Selected Western Streams - 1968-71,
W74-06062 5A

Geology and Water Resources of Eastern Part of Judith Basin, Montana,
W74-06263 2F

Magnitude and Frequency of Floods in Illinois,
W74-06271 2E

Index of Surface Water Stations in Texas, October 1973.
W74-06279 7C

Automatic Collection and Transmission of Hydrological Observations.
W74-06287 7B

Standardization in Hydrology and Related Fields.
W74-06298 7C

Surface Observations, Ground Truth and Data, NASA-USGS Mission 144, Chesapeake Bay Region, Sept. 22-30, 1970,

DIETS
Biological Effects of Fenitrothion in the Diet of Brook Trout,
W74-06169 5C

DIGITAL CONTROL SYSTEMS
Testing Digital Control Systems,
W74-06141 7B

DIGITAL CONTROLS
Stepper Motors Respond to Direct Digital Command,
W74-06100 7B

DIKES
River Improvement.
W74-06200 6E

DILATOMETERS
Automatic Recording Dilatometer,
W74-06148 5A

DILUTERS (PROPORTIONAL)
A Simplified Flow-Splitting Chamber and Siphon for Proportional Diluters,
W74-06094 7B

DIPTEROCARP FORESTS
The Effect of Logging on Hill Dipterocarp Forest,
W74-06454 4C

DISCHARGE
National Pollutant Discharge Elimination System.
W74-06223 6E

DISINFECTION
Ozone Disinfection of Industrial-Municipal Secondary Effluents,
W74-06159 5D

DISSOLVED OXYGEN
The Influence of Dissolved Oxygen on the Growth of Channel Catfish,
W74-06038 5C

Benthic Oxygen Demands of Houston Ship Channel Sediments,
W74-06073 5C

Water Quality Report--Yakima River, December 1970--September 1971,
W74-06261 5B

Survey of the Effect of Ashton Paper Mill Effluent Discharge on the Water of the River Severn,
W74-06414 5C

DISTANCE
Distances of Flowage of Snow Avalanches in the Central and Western Caucasus (Dal'nosti vybrosa snezhnykh lavin na Tsentral'nom i Zapadnom Kavkaze),
W74-06451 2C

DISTRIBUTION
Trace Metals in the North Sea,
W74-06011 5A

DISTRIBUTION PATTERNS
Effects of Artificial Hypolimnion Aeration and Rainbow Trout (Salmo gairdneri Richardson) Depth Distribution,
W74-06041 5C

The Distribution of Asellus Aquaticus (L.) and Proasellus Meridianus (RAC.) in the Southwestern Part of the Netherlands,
W74-06051 5C

Diversity and Longitudinal Zonation in Fish Populations of Two Streams Entering a Metropolitan Area,
W74-06055 2I

Cambarus Buntingi, A New Species of Puncticambarus (Decapoda, Astacidae) from Kentucky and Tennessee,
W74-06056 2I

Influence of Environmental Experience on Response of Yearling Rainbow Trout (Salmo Garidneri) to a Black and White Substrate,
W74-06063 5C

The Distribution of Heavy Metals in Reef-Dwelling Groupers in the Gulf of Mexico and Bahama Islands,
W74-06071 5B

DISTRIBUTION (VERTICAL)
Vertical Distribution of Transparency in Lake Baikal and its Relationship to Biological Indices, (In German),
W74-06237 2H

DIVERSION DAMS
Model and Prototype Analysis of the Old River Diversion on the Mississippi River,
W74-05961 8B

DOMESTIC WASTES
Pollution of the North Sea,
W74-06023 5B

Activated Carbon Adsorption and Polishing of Strong Wastewater,
W74-06411 5D

DOMINANT ORGANISMS
Some Characteristics of an Oscillatoria-Dominated Metalimnetic Phytoplankton Community,
W74-06081 5C

DOSING APPARATUS
A Simplified Flow-Splitting Chamber and Siphon for Proportional Diluters,
W74-06094 7B

DRAINAGE
Drains and Ditches.
W74-06209 6E

Drainage, Flood and Pollution Control.

ECTOCARPUS SILICULOSUS
Effect of Chelation on Toxicity of Copper,
W74-06048 5C

EDTA
Effect of Chelation on Toxicity of Copper,
W74-06048 5C

EFFLUENTS
Ozone Disinfection of Industrial-Municipal Secondary Effluents,
W74-06159 5D

ELECTRIC POWERPLANTS
Kreshtool v. Delmarva Power and Light Co. (Permit to Construct Electric Generating Unit in Coastal Zone)
W74-06201 6E

ELECTRICAL CONDUCTANCE
Problems of Water-Quality Standards in the Management of Ground-Water Basins,
W74-06368 5B

ELECTRICAL STUDIES
Permafrost: Relation Between Ice Content and Dielectric Losses at 100 Deg K,
W74-05994 2C

ELECTROCHEMISTRY
Automation of Direct Potentiometry,
W74-06133 5A

The Standard Potential of the Single-Crystal Copper Electrode in Aqueous Solutions,
W74-06149 2K

Electrochemical Purification of Industrial Effluents (Elektrokhimicheskaya Ochistka Promyshlennykh Stocknykh Vod),
W74-06402 5D

ELECTRODE RESPONSES
Glass Electrode Responses Interpreted by the Solid State Homogeneous- and Heterogeneous-Site Membrane Potential Theory,
W74-06095 2K

ELECTRODES
Prediction of Incipient Lethal Levels of Copper to Juvenile Atlantic Salmon in the Presence of Humic Acid by Cupric Electrode,
W74-06036 5C

Glass Electrode Responses Interpreted by the Solid State Homogeneous- and Heterogeneous-Site Membrane Potential Theory,
W74-06095 2K

The Standard Potential of the Single-Crystal Copper Electrode in Aqueous Solutions,
W74-06149 2K

ELECTRONIC CONTROLLERS
Process Controllers: A Case of Pneumatic-Electronic Coexistence,
W74-06143 7B

ELECTRONIC INTEGRATING THERMOMETER
A Device for Measuring the Average Temperature of Water, Soil, or Air,
W74-06045 5A

ELECTROPHORESIS
Lipopolysaccharide and Proteins of the Cell Envelope of Vibrio Marinus, A Marine Bacterium,
W74-06028 5A

EMBAYMENTS
The Computation of Tides and Currents in Estuaries and Canals: Appendix A: A User's Manual,
W74-06312 2L

EMBRYONIC DEVELOPMENT
Effects of Egg Concentrations of DDT and Dieldrin on Development in Winter Flounder (Pseudopleuronectes Americanus),
W74-06091 5C

EMBRYONIC GROWTH STAGE
The Biology of Gammarus (Crustacea, Amphipoda) in the Northwestern Atlantic, VII. The Duration of Embryonic Development in Five Species at Various Temperatures,
W74-06120 5C

EMINENT DOMAIN
Environmental Law--Zoning--Ordinance Prohibiting Filling Wetlands Adjacent to Navigable Waters Without Permit is Constitutional Exercise of Police Power Not Requiring Payment of Compensation.
W74-06331 6E

EMISSION SPECTROSCOPY
Trace Metals Analysis on Small Oil Samples,
W74-06142 5A

ENDRIN
Endrin Uptake and Release by Fingerling Channel Catfish (Ictalurus Punctatus),
W74-06060 5C

ENFORCEMENT
Oil Terminal Facilities.
W74-06187 6E

A Bill to Provide for the Conservation and Management of Fisheries and for other Purposes.
W74-06215 6E

ENGLAND (RIVER LEA)
Distribution of Vallisneria spiralis L. in the River Lea Navigation Canal (Essex-Hertfordshire Border),
W74-06072 2I

ENTERIC BACTERIA
Lipopolysaccharide and Proteins of the Cell Envelope of Vibrio Marinus, A Marine Bacterium,
W74-06028 5A

Methodology for Recovery and Identification of Enteropathogenic Escherichia Coli,
W74-06151 5A

ENUMERATION
Coliform Counts of Polluted Waters: A Comparison of Media and Methods,
W74-06093 5A

ENVIRONMENT

Management of Protection Forests in Westland,
W74-06488 4A

EROSION CONTROL
Little Creek Watershed Project, Laurens and Wheeler Counties, Georgia (Final Environmental Impact Statement).
W74-05996 4D

Shore Erosion Control.
W74-06326 6E

ERRORS
A Calibration of Instruments with Non-Random Errors,
W74-06026 7B

ESCHERICHIA-COLI
A Bacteriological Study of the Oyster Beds and Shellfish of the Lagoon of Oualidia During 1970, (In French),
W74-06252 5C

ESTUARIES
Benthic Fauna and Zooplankton in Some Polluted Swedish Estuaries,
W74-06043 5C

Accumulation and Movement of Mirex in Selected Estuaries of South Carolina, 1969-71,
W74-06054 5B

The Computation of Tides and Currents in Estuaries and Canals: Appendix A: A User's Manual,
W74-06312 2L

Survey of the Effect of Ashton Paper Mill Effluent Discharge on the Water of the River Severn,
W74-06414 5C

ESTUARINE ENVIRONMENT
Protecting America's Estuaries: Florida.
W74-06010 5G

A Bill to Authorize the Establishment of the Florida Frontier Historic Riverway, and for other Purposes.
W74-06217 6E

Theory, Development, and Utilization Potential of the Biomilieu Concept,
W74-06332 2L

Tropic Analyses of an Estuarine Mangrove Community,
W74-06489 2L

ESTUARINE FISHERIES
Department of Sea and Shore Fisheries: Commissioner.
W74-06192 6E

ETHYLENEDIAMINETETRAACETIC ACID
Mobilization of Some Metals in Water and Animal Tissue by NTA, EDTA and TPP,
W74-06173 5B

EUGLENA-MUTABILIS
Effects of Acid Mine Drainage on the Stream Ecosystem of the East Fork of the Obey River, Tennessee,
W74-06491 5C

EUROTIA-LANATA
Plant Moisture Stress Patterns in Eurotia lanata and Atriplex confertifolia,
W74-06497 2I

EUTROPHICATION
Algal Assays of Archipelago Waters. Quantitative Aspects,
W74-06015 5C

Effects of Artificial Hypolimnion Aeration and Rainbow Trout (Salmo gairdneri Richardson) Depth Distribution,
W74-06041 5C

Enriching Effects of Urban Runoff on the Productivity of a Mesotrophic Lake,
W74-06080 5C

A Preliminary Note on the Sequential Decomposition of Pectin by Aquatic Bacteria,
W74-06092 5B

Criteria for Estimating Limiting Nutrients in Natural Streams,
W74-06105 5C

Response of Anabaena to pH, Carbon, and Phosphorus,
W74-06165 5C

Physical, Chemical, and Biological Characteristics of Conewago Lake Drainage Basin, York County, Pennsylvania,
W74-06259 5C

Nutrient Enrichment and Control Requirements in the Upper Chesapeake Bay, Summary and Conclusions,
W74-06352 5C

EVALUATION
Evaluation of Existing Field Test Kits for Determining Free Chlorine Residuals in Aqueous Solutions,
W74-06162 5A

Alternative Water Resource Systems in the Lower Mekong,
W74-06418 4A

The Hydrological Evaluation of Regional Water-Resource Systems in the United Kingdom,
W74-06421 6B

The Impact of Changing Cost and Quality of Industrial Water on Technical Change and Plant Location Decisions,
W74-06424 3E

An Approach to Evaluation in Multiple Objective River Basin Planning, An Analysis of Selected Water Quantity Alternatives in the Okanagan Valley, British Columbia, Canada,
W74-06425 6A

EVAPORATION CONTROL
Floating Sheets of Foam Rubber for Reducing Stock Tank Evaporation,
W74-06458 3B

EXCRETION
Oysters: Retention and Excretion of Three Types of Human Waterborne Disease Bacteria,
W74-06167 5C

EXPLOSIVE WASTES
Thin-Layer Chromatographic Analysis of HMX in Water,
W74-06033 5A

FABRICATION
Programmable Temperature Controllers,
W74-06145 7C

FARM WASTES
Long-Term Effects of Manure, Fertilizer, and Plow Depth on Chemical Properties of Soils and Nutrient Movement in a Monoculture Corn System,
W74-06346 5B

FATE OF POLLUTANTS
Metabolism of Selected Pesticides by Marine Microorganisms,
W74-06066 5C

A Preliminary Note on the Sequential Decomposition of Pectin by Aquatic Bacteria,
W74-06092 5B

The Fate of Dieldrin in a Model Ecosystem,
W74-06170 5B

FATHEAD MINNOW
Captain Toxicity to Fathead Minnows (Pimephales Promelas), Bluegills (Lepomis Macrochirus), and Brook Trout (Salvelinus Fontinalis),
W74-06085 5C

FEDERAL BUDGETS
Public Works for Water and Power Development and Atomic Energy Commission Appropriation Bill, 1974 Part 3.
W74-06008 6E

FEDERAL GOVERNMENT
Proposed Big Cypress Reserve, Florida.
W74-06005 6E

Water Resources Development--1973.
W74-06007 6E

Public Works for Water and Power Development and Atomic Energy Commission Appropriation Bill, 1974 Part 3.
W74-06008 6E

Protecting America's Estuaries: Florida.
W74-06010 5G

Gage V. Commonwealth Edison Co. (Suit Against AEC and an Electric Company for Alleged Deprivation of Rights Under NEPA).
W74-06212 6E

A Bill to Provide for the Conservation and Management of Fisheries and for other Purposes.
W74-06215 6E

The Long Littered Path to Clean Air and Water,
W74-06234 5D

FEDERAL PROJECT POLICY
A Bill to Authorize the Establishment of the Florida Frontier Historic Riverway, and for other Purposes.
W74-06217 6E

FEDERAL-STATE WATER RIGHTS CONFLICTS
Oppen V. Aetna Insurance Co. (Action for Damages to Pleasure Boats Resulting from Oil Spill Disaster).
W74-06181 6E

FEDERAL WATER POLLUTION CONTROL ACT
A Regional View on the Use of Land for Disposal of Municipal Sewage and Sludge,
W74-05969 5D

A Bill to Amend Title II of the Water Pollution Control Act Amendments of 1972 (Public Law 92-500).
W74-06208 6E

FEDERAL WATER POLLUTION CONTROL ACT (FWPCA)
Concurrent Resolution Concerning the Administration of the Federal Water Pollution Control Act Amendments of 1972.
W74-06180 6E

FEEDING RATES
The Influence of Dissolved Oxygen on the Growth of Channel Catfish,
W74-06038 5C

FENITROTHION
Biological Effects of Fenitrothion in the Diet of Brook Trout,
W74-06169 5C

FERTILIZERS
Engineering and Economics of Sludge Handling,
W74-05981 5D

Effect of Some Forms of Nitrogen Fertilizers on the Development and Chemical Composition of the Flue Cured Tobacco at Different Soil Moisture, (In Polish),
W74-06137 3F

Contribution to the Study of the Action of Water-Soluble and Citrate-Soluble Phosphoric Under Acids Different Moisture Conditions, (In Serbo-Croation),
W74-06315 3C

Long-Term Effects of Manure, Fertilizer, and Plow Depth on Chemical Properties of Soils and Nutrient Movement in a Monoculture Corn System,
W74-06346 5B

FERTILIZERS (MINERAL)
Consumption of Water by the Cotton Plant at Different Concentrations of Soil Solution, (In Russian),
W74-06236 3C

FILTERS
Prefabricated Filter-Fin for Subsurface Drains,
W74-06348 4A

FILTRATION
Can Screened White Water be Recycled to Shower Felts,
W74-06384 5D

FINITE ELEMENT ANALYSIS
Approximate Solution for Unconfined Seepage,
W74-06338 4A

FIREHOLE RIVER (WYO)
Effects of Thermal Additions from the Yellowstone Geyser Basins on the Benthic Algae of the Firehole River,
W74-06046 5C

FISH
Apparatus for Control of Poison Concentration in Toxicity Studies with Fish,
W74-06174 5C

A Bill to Amend the Fish and Wildlife Coordination Act, and for Other Purposes.
W74-06176 6E

Powers and Duties of Department of Fish and Wildlife.
W74-06184 6E

A Bill to Provide for the Conservation and Management of Fisheries and for other Purposes.
W74-06215 6E

FISH BEHAVIOR
Influence of Environmental Experience on Response of Yearling Rainbow Trout (Salmo Garidneri) to a Black and White Substrate,
W74-06063 5C

Biological Effects of Fenitrothion in the Diet of Brook Trout,
W74-06169 5C

FISH CONSERVATION
A Bill to Provide for the Conservation and Management of Fisheries and for other Purposes.
W74-06215 6E

The Fish-Meal Industry of Iquique,
W74-06477 3F

FISH DIETS
Influence of Salinity on Protein Requirements of Rainbow Trout (Salmo Gairdneri) Fingerlings,
W74-06086 5C

FISH EGGS
Guide to Identity of Eggs and Larvae of Some Gulf of Mexico Clupeid Fishes,
W74-06067 2L

Effects of Egg Concentrations of DDT and Dieldrin on Development in Winter Flounder (Pseudopleuronectes Americanus),
W74-06091 5C

FISH HARVEST
The Fish-Meal Industry of Iquique,
W74-06477 3F

FISH MANAGEMENT
A Bill to Provide for the Conservation and Management of Fisheries and for other Purposes.
W74-06215 6E

FISH POOLS
Observations on Water Fleas (Cladocera) in the Trout Pools at the Biological Station Lunz (Lower Austria),
W74-06248 2H

FISH POPULATIONS
Pesticide Residues in Natural Fish Populations of the Smoky Hill River of Western Kansas - 1967-69, 10H. E. Klaassen, and
W74-06052 5A

Diversity and Longitudinal Zonation in Fish Populations of Two Streams Entering a Metropolitan Area,
W74-06055 2I

FISH PROTEIN CONCENTRATE
Inability to Detect Spores of Clostridium Botulinum in Fish Protein Concentrates (FPC),
W74-06058 5A

FISH TAXONOMY
Guide to Identity of Eggs and Larvae of Some Gulf of Mexico Clupeid Fishes,
W74-06067 2L

FISH VISION
Effect of Illumination and Water Temperature on Critical Flow Rates for Fish, (In Russian),
W74-06250 2I

FISHERIES
A Bill to Amend the Fish and Wildlife Coordination Act to Provide for the Preservation of Natural Game Fish Streams.
W74-06214 6E

A Bill to Provide for the Conservation and Management of Fisheries and for other Purposes.
W74-06215 6E

Aquacultural Developments in Peru,
W74-06353 3F

FISHING
The Fish-Meal Industry of Iquique,
W74-06477 3F

FJORDS
Succession in Benthic Macrofauna in a Swedish Fjord Subsequent to the Closure of a Sulphite Pulp Mill,
W74-06013 5C

FLAGELLATES
A Method for the Isolation of Naegleria Species from Water Samples,
W74-06068 5C

FLOOD CONTROL
River Improvement.
W74-06200 6E

Drainage, Flood and Pollution Control.
W74-06216 6E

Alternative Water Resource Systems in the Lower Mekong,
W74-06418 4A

FLOOD DAMAGE
Burnt Creek RC and D Measure for Flood Prevention (Final Environmental Statement).
W74-06002 4A

FLOOD FREQUENCY
Magnitude and Frequency of Floods in Illinois,
W74-06271 2E

FLOOD MAPPING
Flood Prone Areas in the San Francisco Bay Region, California,
W74-06275 7C

FLOOD PLAIN INSURANCE
A Bill to Expand the National Flood Insurance Program by Substantially Increasing Limits of Coverage and Total Amount of Insurance Authorized to be Outstanding and by Requiring Known Flood Prone Communities to Participate in the Program and for Other Purposes.
W74-06179 6E

FLOOD PLAIN ZONING
A Bill to Expand the National Flood Insurance Program by Substantially Increasing Limits of Coverage and Total Amount of Insurance Authorized to be Outstanding and by Requiring Known Flood Prone Communities to Participate in the Program and for Other Purposes.
W74-06179 6E

Floodway Regulations.
W74-06189 6E

FLOOD PLAINS
A Bill to Expand the National Flood Insurance Program by Substantially Increasing Limits of Coverage and Total Amount of Insurance Authorized to be Outstanding and by Requiring Known Flood Prone Communities to Participate in the Program and for Other Purposes.
W74-06179 6E

FLOOD-PRONE AREAS
Flood Prone Areas in the San Francisco Bay Region, California,
W74-06275 7C

FLOOD PROTECTION
Burnt Creek RC and D Measure for Flood Prevention (Final Environmental Statement).
W74-06002 4A

Floodway Regulations.
W74-06189 6E

FLOODPLAINS
Floodway Regulations.
W74-06189 6E

FLOODS
A Bill to Expand the National Flood Insurance Program by Substantially Increasing Limits of Coverage and Total Amount of Insurance Authorized to be Outstanding and by Requiring Known Flood Prone Communities to Participate in the Program and for Other Purposes.
W74-06179 6E

Flood of July 17, 1972 in Gallup, New Mexico,
W74-06267 2E

Magnitude and Frequency of Floods in Illinois,
W74-06271 2E

Flood Prone Areas in the San Francisco Bay Region, California,
W74-06275 7C

Flood of September 3, 1972, in Hillsboro, New Mexico,
W74-06299 2E

Flood of September 1971 in Southeastern Pennsylvania,
W74-06354 2E

FLOODWATER
Water Quality Effects of Seepage from Earthen Dams,
W74-06453 5B

FLORIDA
Proposed Big Cypress Reserve, Florida.
W74-06005 6E

Protecting America's Estuaries: Florida.
W74-06010 5G

Trace Metals in Carbonate and Organic Rich Sediments,
W74-06050 5A

Nutrient-Productivity Relationships in a Bayou Estuary,
W74-06160 5C

Save Our Bay, Inc. v. Hillsborough County Pollution Control Commission (Action Seeking to Prevent Water Pollution).
W74-06203 6E

A Bill to Authorize the Establishment of the Florida Frontier Historic Riverway, and for other Purposes.
W74-06217 6E

Water and Sewer System Regulatory Law.
W74-06224 6E

A Blocked Minimal Tropical Depression Becomes a Storm of Rare Occurrence,
W74-06357 2B

FLORIDA (NORTH RIVER BASIN)
Tropic Analyses of an Estuarine Mangrove Community,
W74-06489 2L

FLUCTUATIONS
Asynchronous Long-Period Streamflow Fluctuations in the European USSR (Asinkhronnost' mnogoletnikh kolebaniy stoka rek yevropeyskoy territorii SSSR),
W74-06305 2E

FLUORENES
Hepatic Tumors in the Guppy (Lebistes reticulatus) Induced by Aflatoxin B1, Dimethylnitrosamine and 2-Acetylaminofluorene,
W74-06438 5C

FLUORIDES
Aluminum in Fluoridated Drinking Water: Analytical and Physiological Problems,
W74-06164 5A

Fluorine in Some Natural Waters of Tadzhikistan (Ftor v nekotorykh prirodnykh vodakh Tadzhikistana),
W74-06310 2K

FLUORINE
Fluorine in Some Natural Waters of Tadzhikistan (Ftor v nekotorykh prirodnykh vodakh Tadzhikistana),
W74-06310 2K

FLUROMETRY
Detection of Organophosphorous Pesticides by in Situ Fluorometry on Thin-Layer Chromatograms,
W74-06025 5A

FOG
Sixth Annual Survey Report on the Air Weather Service Weather Modification Program (FY 1973),
W74-06356 3B

FOG DISPERSAL
Sixth Annual Survey Report on the Air Weather Service Weather Modification Program (FY 1973),
W74-06356 3B

FOG DISSIPATION (ARTIFICIAL)
Sixth Annual Survey Report on the Air Weather Service Weather Modification Program (FY 1973),
W74-06356 3B

FOGS
The utilization of the Namib Desert, Southwest Africa,
W74-06483 4A

FOOD CHAINS
Methyl Mercury Accumulation in an Aquatic Food Chain. A Model and some Implications for Research Planning,
W74-06042 5B

FOOD CONVERSION (FISH)
Growth and Food Conversion of Rainbow Trout Reared in Brackish and Fresh Water,
W74-06492 2I

FOOD HABITS
Food Habits and Feeding Chronology of the Blackbanded Darter, Percina nigrofasciata (Agassiz), in Halawakee Creek, Alabama,
W74-06493 2I

FOOD WEBS
Relationships Between Levels of Radiocesium in Dominant Plants and Arthropods in a Contaminated Streambed Community,
W74-06016 5C

FORAGE GRASSES
Ecological Impacts: Part 1--Range and Range Livestock production,
W74-06443 3B

FORECASTING
Areal Snow Cover Observations in the Central Rockies, Colorado,
W74-06391 2C

FOREIGN RESEARCH
Color Removal Process.
W74-06399 5D

FOREST MANAGEMENT
A Literature Review of Timber-Harvesting Effects on Stream Temperatures: Research Needs for the Southwest,
W74-06437 4C

Soil Moisture Patterns on Two Chained Pinyon-Juniper Sites in Utah,
W74-06459 2G

Management of Protection Forests in Westland,
W74-06488 4A

FOREST PLANTING
Draining and Reclamation of Swampy Forest Lands, (In Russian),
W74-06439 4A

FORESTS
The Effect of Logging on Hill Dipterocarp Forest,
W74-06454 4C

FORMALDEHYDE
Liquid-Phase Oxidation of Phenol, Methanol, and Formaldehyde for Purification of Industrial Effluents (Zhidkofaznoe okislenie fenola, metanola i formal'degida primenitel'no k ochistke stochnykh vod),
W74-06403 5D

FRANCISELLA
Oysters: Retention and Excretion of Three Types of Human Waterborne Disease Bacteria.
W74-06167 5C

FREE SURFACES
Approximate Solution for Unconfined Seepage.
W74-06338 4A

FREEZING
NMR Studies of Water Adsorbed on a Number of Silica Surfaces.
W74-06405 2K

FRESHWATER FISH
Pesticide Residues in Natural Fish Populations of the Smoky Hill River of Western Kansas - 1967-69, 10H. E. Klaassen, and
W74-06052 5A

FRESNO (CALIF)
The City of Fresno's Leaky Acres Ground-Water Recharge Project--Construction and Performance,
W74-06358 4B

Nitrates and Ground-Water Management in the Fresno Urban Area.
W74-06367 5B

FROZEN GROUND
Permafrost: Relation Between Ice Content and Dielectric Losses at 100 Deg K.
W74-05994 2C

FUNGI
Mycological Applications of X-Ray Microanalysis,
W74-06096 5A

Interactions Between DDT and River Fungi. II. Influence of Culture Conditions on the Compatibility of Fungi and p,p'-DDT.
W74-06123 5C

GAGING STATIONS
Index of Surface Water Stations in Texas, October 1973.
W74-06279 7C

GAMMARUS
The Biology of Gammarus (Crustacea, Amphipoda) in the Northwestern Atlantic, VII. The Duration of Embryonic Development in Five Species at Various Temperatures,
W74-06120 5C

GARDEN BEETS (BETA VULGARIS)
Interactive Effects of Salinity and Ozone on Growth and Yield of Garden Beet,
W74-06342 3C

GAS CHROMATOGRAPHY
Photodecomposition of Chlorinated Biphenyls and Dibenzofurans,
W74-06125 5B

Determination of Residues of Mesurol and its Toxic Metabolites in Plant and Animal Tissues,
W74-06128 5A

Pesticides in Effluents and Polluted River Water,
W74-06130 5A

Identification of Substances in Petroleum Causing Objectionable Odour in Fish,
W74-06140 5A

GAS LIQUID CHROMATOGRAPHY
Uptake and Accumulation of an Organochlorine Insecticide (Dieldrin) by an Estuarine Mollusc, Rangia Cuneata,
W74-06031 5C

GASOLINE
Chemical Pollution of Ground Waters,
W74-06365 5B

GELS
Characterisation and Magnetic Properties of Natural Ferric Gel,
W74-05992 2K

GEOCHEMISTRY
Helium Isotopes in Ocean Sediments (Izotopy geliya v osadkakh okeanov),
W74-06307 2J

Arsenic and Antimony in the Tropical Zone of the Atlantic Ocean (Mysh'yak i sur'ma v tropicheskoy zone Atlanticheskogo okeana),
W74-06309 2K

GEOLOGY
Geology and Geomorphology of the Central Gulf of Alaska Continental Shelf,
W74-06434 2L

GEOMORPHOLOGY
Geology and Geomorphology of the Central Gulf of Alaska Continental Shelf,
W74-06434 2L

The Plio-Quaternary Climatic Changes Along the Semiarid Seaboard of Chile,
W74-06478 2B

GEORGIA
Little Creek Watershed Project, Laurens and Wheeler Counties, Georgia (Final Environmental Impact Statement).
W74-05996 4D

A Planning Concept for the Georgia Coastal Zone.
W74-05998 2L

Sensitivity Analysis of a Thunderstorm Rainfall Model,
W74-06101 2B

GERMANY (HAMBURG)
Contributions to the Knowledge About the Biology and Ecology of Freshwater Ostracods From the Neighborhood of Hamburg, (in German),
W74-06420 2H

GERMANY (MINDEL LAKE)
A Preliminary Note on the Sequential Decomposition of Pectin by Aquatic Bacteria,
W74-06092 5B

GEYSERS
Effects of Thermal Additions from the Yellowstone Geyser Basins on the Benthic Algae of the Firehole River,
W74-06046 5C

GLACIAL DRIFT
Investigations--Ground Water Conditions in the Vicinity of Plaza, Spokane County, Washington,
W74-06436 4B

GLACIATION
Geology and Geomorphology of the Central Gulf of Alaska Continental Shelf,
W74-06434 2L

GLACIERS
Extra-Terrestrial Mn-53 in Antarctic Ice,
W74-05991 2C

Glaciers--A Picture Story,
W74-06276 2C

GLACIOHYDROLOGY
Regional Sediment Yield Analysis of Alaska Streams,
W74-06440 2J

GLACIOLOGY
Glaciers--A Picture Story,
W74-06276 2C

GOLDFISH
Influence of Appearance of Prey and Satiation of Predator on Food Selection by Northern Pike (Essox lucius),
W74-06102 8I

GOUTWEED
Effect of Water Deficiency and Light Regime on Photosynthetic Activity of Leaves, (In Russian),
W74-06246 2I

GOVERNMENT FINANCE
Concurrent Resolution Concerning the Administration of the Federal Water Pollution Control Act Amendments of 1972.
W74-06180 6E

A Bill to Amend Title II of the Water Pollution Control Act Amendments of 1972 (Public Law 92-500).
W74-06208 6E

Municipalities--Water Mains.
W74-06219 6E

GOVERNMENT FINANCING
Cibolo Project, Texas.
W74-06004 6E

A Bill to Amend the Project for Flood Protection on Indian Bend Wash, Maricopa County, Arizona, Authorized by the Flood Control Act of 1965.
W74-06178 6E

GOVERNMENTAL INTERRELATIONS
United States Oceans Politics,
W74-06329 6E

GOVERNMENTS
A Summary-Digest of State Water Laws.
W74-06006 6E

Water and Sewer System Regulatory Law.
W74-06224 6E

GRASSLAND YIELDS
Yield Determinations in Permanent Pastures at Different Locations: Interactions Between Location and Manuring Intensity, (In German),
W74-06251 3F

GRASSLANDS
Growth and Moisture Availability of Shelterbelts in the Kulunda Steppe (Rost i vlagoobespechennost' lesnykh polos v Kulundinskoy stepi),
W74-06301 2G

Distinctive Hydrogeological Characteristics of Some Pampas of the Peruvian Coastal Region,
W74-06472 4B

GRAVEL MINING
Impact of Mining Gravel from Urban Stream Beds in the Southwestern United States,
W74-06374 4C

GRAVITY DAMS
A Computer Program for Earthquake Analysis of Gravity Dams Including Hydrodynamic Interaction,
W74-06280 8A

Earthquake Response of Gravity Dams Including Reservoir Interaction Effects,
W74-06359 8A

GREAT SALT LAKE
The Effects of Restricted Circulation on the Salt Balance of Great Salt Lake, Utah,
W74-06435 2H

GREENHOUSES
Plastic Oases for Arid Seashores,
W74-06468 3A

GROUNDWATER
Solid Waste Disposal.
W74-06191 6E

Appraisal of the Quality of Ground Water in the Helena Valley, Montana,
W74-06269 2F

Ground Water Pollution from Subsurface Excavations: Part 1. Source Identification and Evaluation.
W74-06277 5B

Tensiometer Use in Shallow Ground-Water Studies,
W74-06343 4B

Water Quality and Other Aspects of Ground-Water Recharge in Southern California,
W74-06366 5B

Nitrates and Ground-Water Management in the Fresno Urban Area,
W74-06367 5B

Problems of Water-Quality Standards in the Management of Ground-Water Basins,
W74-06368 5B

Summary of Water-Level and Pumpage Data in the Cheyenne and Federal Municipal Well Fields, April 1, 1972 to April 2, 1973, Cheyenne, Wyoming.
W74-06369 4B

The Content of Some Natural Radioactive Elements, Especially Rn-222, in Some Potable Waters in Sweden,
W74-06372 2K

Investigations--Ground Water Conditions in the Vicinity of Plaza, Spokane County, Washington,
W74-06436 4B

Subsurface Component of the Hydrologic Budget of the Caspian Sea (O podzemnoy sostavlyayushchey vodnogo balansa Kaspiyskogo morya),
W74-06449 2F

Artificial Recharge of Groundwater by Local Surface Runoff (Iskusstvennoye vospolneniye zapasov podzemnykh vod za schet mestnogo poverkhnostnogo stoka),
W74-06450 4B

Distinctive Hydrogeological Characteristics of Some Pampas of the Peruvian Coastal Region,
W74-06472 4B

GROUNDWATER RECHARGE
Artificial Recharge of Groundwater by Local Surface Runoff (Iskusstvennoye vospolneniye

zapasov podzemnykh vod za schet mestnogo poverkhnostnogo stoka),
W74-06450 4B

GROUNDWATER RESOURCES
Groundwater Management,
W74-06334 4B

GROUNDWATERS
Cibolo Project, Texas.
W74-06004 6E

GROUPERS
The Distribution of Heavy Metals in Reef-Dwelling Groupers in the Gulf of Mexico and Bahama Islands,
W74-06071 5B

GROWTH
Growth and Food Conversion of Rainbow Trout Reared in Brackish and Fresh Water,
W74-06492 2I

GROWTH RATES
The Influence of Dissolved Oxygen on the Growth of Channel Catfish,
W74-06038 5C

Endrin Uptake and Release by Fingerling Channel Catfish (Ictalurus Punctatus),
W74-06060 5C

Changes in Periphytic Algae Following Bicarbonate Additions to a Small Stream,
W74-06087 5C

Interactions Between DDT and River Fungi. II. Influence of Culture Conditions on the Compatibility of Fungi and p,p'-DDT,
W74-06123 5C

Oxidation-Reduction Potential and Growth of Salmonella and Pseudomonas Fluorescens,
W74-06134 5C

Carbon and Nitrogen as Regulators of Algal Growth,
W74-06166 5C

Competitive Growth of Salmonella and Pseudomonads in Tetrathionate Enrichment Broth,
W74-06168 5C

Interactive Effects of Salinity and Ozone on Growth and Yield of Garden Beet,
W74-06342 3C

Growth , Life History, and Respiration of Mysis relicta in an Arctic and Temperate Lake,
W74-06500 2H

GULF OF ALASKA
A Review of the Oceanography and Renewable Resources of the Northern Gulf of Alaska.
W74-06426 2L

Physical Oceanography of the Northern Gulf of Alaska,
W74-06427 2L

Chemical Oceanography of the Gulf of Alaska,
W74-06428 2L

The Intertidal Region of the Gulf of Alaska,
W74-06430 2L

Coastal Weather, Tides and Wind Waves of the Northern Gulf of Alaska,
W74-06431 2L

Oil and Gas Seeps of the Northern Gulf of Alaska,
W74-06432 5B

The Land Hydrology of the South-Central Coastal Zone,
W74-06433 2L

Geology and Geomorphology of the Central Gulf of Alaska Continental Shelf,
W74-06434 2L

GULF OF MEXICO
Guide to Identity of Eggs and Larvae of Some Gulf of Mexico Clupeid Fishes,
W74-06067 2L

The Distribution of Heavy Metals in Reef-Dwelling Groupers in the Gulf of Mexico and Bahama Islands,
W74-06071 5B

GUPPY
Effect of Water Hardness on the Tolerance of the Guppy to Beryllium Sulfate,
W74-06034 5C

HABITATS
Rucker V. Willis (Suit to Enjoin Construction).
W74-06230 6E

HALOBATES SPP
Can Halobates Dodge Nets. I: By Daylight.,
W74-06117 2I

Can Halobates Dodge Nets. II: By Moonlight.,
W74-06118 2I

HARBORS
Oppen V. Aetna Insurance Co. (Action for Damages to Pleasure Boats Resulting from Oil Spill Disaster).
W74-06181 6E

Buffalo Harbor, New York (Maintenance), (Final Environmental Impact Statement).
W74-06197 8A

Harbors and Rivers.
W74-06221 6E

Environment, Water and Sediments of Christiansted Harbor, St. Croix,
W74-06292 5C

HARDNESS (WATER)
Effect of Water Hardness on the Tolerance of the Guppy to Beryllium Sulfate,
W74-06034 5C

HAWAII
Effects of Well Injection on a Basaltic Ghyben-Herzberg Aquifer,
W74-06264 5B

HAZELNUT
Effect of Water Deficiency and Light Regime on Photosynthetic Activity of Leaves, (In Russian),
W74-06246 2I

HEATED GRAPHITE ATOMIZER
The Determination of Trace Transition Elements in Biological Tissues Using Flameless Atom Reservoir Atomic Absorption,
W74-06132 5A

HEAVY METALS
Inorganic Reactions of Sewage Wastes with Soils,
W74-05973 5D

Trace Metals in the North Sea,
W74-06011 5A

Trace Metals in Sediments of New York Bight,
W74-06012 5A

Multielement Instrumental Neutron Activation Analysis of Biological Tissue Using a Single Comparator Standard and Data Processing by Computer,
W74-06022 5A

The Acute Toxicity of Some Heavy Metal Ions toward Benthic Organisms,
W74-06035 5C

Pollution Studies in the Clyde Sea Area,
W74-06049 5C

Trace Metals in Carbonate and Organic Rich Sediments,
W74-06050 5A

International Cooperative Study of Organochlorine and Mercury Residues in Wildlife, 1969-71,
W74-06053 5A

The Distribution of Heavy Metals in Reef-Dwelling Groupers in the Gulf of Mexico and Bahama Islands,
W74-06071 5B

Solvent Extraction of Copper (II) and Zinc (II) with 1,5-Diphenylcarbazone,
W74-06088 5A

Studies with Dithizone. Part XXX. Complexes of Metals, with S-Methyldithizone and the Methylation of Metal Dithizonates,
W74-06122 5A

Mobilization of Some Metals in Water and Animal Tissue by NTA, EDTA and TPP,
W74-06173 5B

HEAVY WATER
NMR Studies of Water Adsorbed on a Number of Silica Surfaces,
W74-06405 2K

HELENA VALLEY (MONT)
Appraisal of the Quality of Ground Water in the Helena Valley, Montana,
W74-06269 2F

HELIUM
Helium Isotopes in Ocean Sediments (Izotopy geliya v osadkakh okeanov),
W74-06307 2J

HELLGRAMMITES
The Effects of Dibrom on Respiratory Activity of the Stonefly, Hydroperla Crosbyi, Hellgrammite, Corydalus Cornutus and the Golden Shiner, Notemigonus Crysoleucas,
W74-06040 5C

HEMLOCK LAKE (MICH)
Effects of Artificial Hypolimnion Aeration and Rainbow Trout (Salmo gairdneri Richardson) Depth Distribution,
W74-06041 5C

HERBICIDES
Nitrogen and Phosphorus Release from Decaying Water Milfoil,
W74-06018 5C

2, 4, 5-T,
W74-06027 5C

Herbicide Analysis by Pulse Polarography-Ficloram,
W74-06127 5A

Soil Moisture Response to Spraying Big Sagebrush the Year of Treatment,
W74-06462 2I

HERRINGS
Guide to Identity of Eggs and Larvae of Some Gulf of Mexico Clupeid Fishes,
W74-06067 2L

HETEROTROPHY
The Heterotrophic Capabilities of Cyclotella Meneghiniana,
W74-06090 5C

HIGH FREQUENCY OSCILLATORS
Response Time of High-Frequency Oscillator-Type Proximity Detectors,
W74-06144 7B

HIGHWAYS
Highways and Environment,
W74-06114 6G

HILLSBORO (N MEX)
Flood of September 3, 1972, in Hillsboro, New Mexico,
W74-06299 2E

HMX
Thin-Layer Chromatographic Analysis of HMX in Water,
W74-06033 5A

HOMEOHYDROUS PLANTS
Effect of Dehydration on Atpase Activity in Poikilohydrous and Homeohydrous Plants, (In Russian),
W74-06255 2I

HOT SPRINGS
Attachment of Bacteria to Sulphur in Extreme Environments,
W74-06065 5B

HOUSTON SHIP CHANNEL (TEX)
Benthic Oxygen Demands of Houston Ship Channel Sediments,
W74-06073 5C

HUDSON RIVER
The Acute Toxicity of Some Heavy Metal Ions toward Benthic Organisms,
W74-06035 5C

HUMAN DISEASES (BLINDNESS)
Incidence of, and Beliefs About, Onchocerciasis in the Senegal River Basin,
W74-06231 5C

HUMAN POPULATION
Indiana 1950-1970: Life Tables for the 14 Economic Regions and Analysis with Measures of Medical Care,
W74-05952 6B

HUMIDITY
Stomatal Responses to Changes in Humidity in Plants Growing in the Desert,
W74-06241 2I

HUNGARY (LAKE BALATON)
The Occurrence of Rhizochrysis limnetica G. M. Smith in the Plankton of Lake Balaton,
W74-06337 2H

HYDRAULIC MODELS
Model and Prototype Analysis of the Old River Diversion on the Mississippi River,
W74-05961 8B

Physical Model Study of Border-Strip Irrigation,
W74-06340 3F

HYDRAULIC STRUCTURES
Municipalities--Water Mains.
W74-06219 6E

HYDROBIOLOGICAL STUDIES
Hydrobiological Investigations in Dam Reservoirs of Poland, (In Polish),
W74-06242 2H

HYDROCARBON-OXIDIZING BACTERIA
Hydrocarbon-Oxidizing Bacteria and Their Possible Use as Controlling Agents of Oil Pollution in the Ocean,
W74-06075 5B

Biodegradation of Oil,
W74-06076 5B

Thermal Death of a Hydrocarbon Bacterium in a Nonaqueous Fluid,
W74-06098 5C

HYDROELECTRIC POWER
Public Works for Water and Power Development and Atomic Energy Commission Appropriation Bill, 1974 Part 3.
W74-06008 6E

Water Power.
W74-06182 6E

Alternative Water Resource Systems in the Lower Mekong,
W74-06418 4A

HYDROELECTRIC PROJECT
Water Power.
W74-06182 6E

HYDROGEN ION CONCENTRATION
Response of Anabaena to pH, Carbon, and Phosphorus,
W74-06165 5C

Contributions to the Knowledge About the Biology and Ecology of Freshwater Ostracods From the Neighborhood of Hamburg, (in German),
W74-06420 2H

A Calibration of Instruments with Non-Random Errors,
W74-06026 7B

A Device for Measuring the Average Temperature of Water, Soil, or Air,
W74-06045 5A

Diel and Annual Cycles of Net Plankton Photosynthesis in Lake Ontario,
W74-06083 5C

A Simple Turbidimeter for Rapid Determination of Low Bacteria Concentrations,
W74-06147 5A

Automatic Recording Dilatometer,
W74-06148 5A

The Standard Potential of the Single-Crystal Copper Electrode in Aqueous Solutions,
W74-06149 2K

Apparatus for Control of Poison Concentration in Toxicity Studies with Fish,
W74-06174 5C

MEDICAL CARE
Indiana 1950-1970: Life Tables for the 14 Economic Regions and Analysis with Measures of Medical Care,
W74-05952 6B

MEDITERRANEAN
Sedimentary Reflection of Depositional Environment in the Bardawil Lagoon, Northern Sinai,
W74-06283 2L

MEKONG RIVER BASIN
Alternative Water Resource Systems in the Lower Mekong,
W74-06418 4A

MEMBRANE PROCESSES
Study of Hydrophilic Membranes for Oil-Water Separation,
W74-06360 5D

MERCURY
Transfer of Heavy Metal Pollutants from Lake Erie Bottom Sediments to the Overlying Water,
W74-05956 5B

System Simulation to Identify Environmental Research Needs: Mercury Contamination,
W74-06014 5B

Methyl Mercury Accumulation in an Aquatic Food Chain. A Model and some Implications for Research Planning,
W74-06042 5B

International Cooperative Study of Organochlorine and Mercury Residues in Wildlife, 1969-71,
W74-06053 5A

The Toxicity of Mixtures of Metals and Surfactants to Rainbow Trout (Salmo Gairdneri Rich.),
W74-06138 5C

Loss of Mercury(II) from Solution,
W74-06266 5B

MESOTROPHY
Enriching Effects of Urban Runoff on the Productivity of a Mesotrophic Lake,
W74-06080 5C

MESUROL
Determination of Residues of Mesurol and its Toxic Metabolites in Plant and Animal Tissues,
W74-06128 5A

METABOLISM
Metabolism of Selected Pesticides by Marine Microorganisms,
W74-06066 5C

METABOLISM (PLANTS)
Water Metabolism and Dynamics of Labeled Phosphorus in Apple Leaves, (In Russian),
W74-06245 3F

METABOLITES
Determination of Residues of Mesurol and its Toxic Metabolites in Plant and Animal Tissues,
W74-06128 5A

METAL CHELATES
Studies with Dithizone. Part XXX. Complexes of Metals, with S-Methyldithizone and the Methylation of Metal Dithizonates,
W74-06122 5A

METAL IONS
The Acute Toxicity of Some Heavy Metal Ions toward Benthic Organisms,
W74-06035 5C

METEOROLOGICAL DATA
Economic Development of the Australian Coastal Deserts,
W74-06484 6B

METEOROLOGY
Tables and Conversions for Microclimatology,
W74-06389 2B

The Coastal Desert of Chile,
W74-06473 2B

METHANOL (METHYL ALCOHOL)
Liquid-Phase Oxidation of Phenol, Methanol, and Formaldehyde for Purification of Industrial Effluents (Zhidkofaznoe okislenie fenola, metanola i formal'degida primenitel'no k ochistke stochnykh vod),
W74-06403 5D

METHODOLOGY
Coliform Counts of Polluted Waters: A Comparison of Media and Methods,
W74-06093 5A

A Selective Microscale X-ray Fluorescence Analyzing Method for Determination of Trace Elements,
W74-06135 5A

Methodology for Recovery and Identification of Enteropathogenic Escherichia Coli,
W74-06151 5A

METHYLAMINES
Possible Microbial Contribution to Nitrosamine Formation in Sewage and Soil,
W74-06136 5B

METHYLATION
Studies with Dithizone. Part XXX. Complexes of Metals, with S-Methyldithizone and the Methylation of Metal Dithizonates,
W74-06122 5A

METHYLDITHIZONE
Studies with Dithizone. Part XXX. Complexes of Metals, with S-Methyldithizone and the Methylation of Metal Dithizonates,
W74-06122 5A

METHYLMERCURY
Methyl Mercury Accumulation in an Aquatic Food Chain. A Model and some Implications for Research Planning,
W74-06042 5B

MICHIGAN
Some Experiences in Land Acquisition for a Land Disposal System for Sewage Effluent,
W74-05966 5D

Effects of Artificial Hypolimnion Aeration and Rainbow Trout (Salmo gairdneri Richardson) Depth Distribution,
W74-06041 5C

Diversity in Fresh-Water Phytoplankton,
W74-06057 5C

Local River Management.
W74-06228 6E

Water Resources Commission.
W74-06229 6E

Water Zoning: The Management of Surface Activity on Lakes, Streams, Rivers and Bays,
W74-06377 6B

Watervliet Paper Completes Waste Water Disposal System.
W74-06415 5D

MICROANALYSIS
Mycological Applications of X-Ray Microanalysis,
W74-06096 5A

MICROBIAL ACTIVITY
Possible Microbial Contribution to Nitrosamine Formation in Sewage and Soil,
W74-06136 5B

MICROBIAL DEGRADATION
Metabolism of Selected Pesticides by Marine Microorganisms,
W74-06066 5C

Hydrocarbon-Oxidizing Bacteria and Their Possible Use as Controlling Agents of Oil Pollution in the Ocean,
W74-06075 5B

Biodegradation of Oil,
W74-06076 5B

A Preliminary Note on the Sequential Decomposition of Pectin by Aquatic Bacteria,
W74-06092 5B

MICROCLIMATOLOGY
Tables and Conversions for Microclimatology,
W74-06389 2B

MICROWAVES
Toward Radscat Measurements Over the Sea and Their Interpretation,
W74-06361 7B

MIDDLE EAST
Desalted Seawater for Agriculture: It is Economical,
W74-06467 3A

MILLET
The Influence of Dry Periods at Various Stages of Development: Investigations of the Water Economy in Oats and Millet,
W74-06243 3F

MINE DRAINAGE
Water Quality Maintenance,
W74-06330 5G

Mine Water Purification by Reverse Osmosis,
W74-06409 5D

MINE WASTES
Effects of Acid Mine Drainage on the Stream Ecosystem of the East Fork of the Obey River, Tennessee,
W74-06491 5C

MINE WATER
Mine Water Purification by Reverse Osmosis,
W74-06409 5D

MINERALOGY
The Continental Shelf Lands of the United States: Mineral Resources and the Laws Affecting Their Development, Exploitation, and Investment Potential,
W74-06000 6E

MINING
Game and Fresh Water Fish,
W74-06222 6E

MINNOWS
Captain Toxicity to Fathead Minnows (Pimephales Promelas), Bluegills (Lepomis Macrochirus), and Brook Trout (Salvelinus Fontinalis),
W74-06085 5C

MIREX
Mirex Incorporation in the Environment: Toxicity in Selected Freshwater Organisms,
W74-06032 5C

Accumulation and Movement of Mirex in Selected Estuaries of South Carolina, 1969-71,
W74-06054 5B

MISSISSIPPI
Mirex Incorporation in the Environment: Toxicity in Selected Freshwater Organisms,
W74-06032 5C

MISSISSIPPI RIVER
Model and Prototype Analysis of the Old River Diversion on the Mississippi River,
W74-05961 8B

A Bill to Create an Upper Mississippi River Recreational Area.
W74-06175 6E

MISSOURI RIVER
Nitrogen Losses in Surface Runoff from Agricultural Watersheds on Missouri Valley Loess,
W74-06345 5B

MODEL STUDIES
A Multilayer Aquifer Model of the Ogallala Formation in Oklahoma,
W74-05962 2F

System Simulation to Identify Environmental Research Needs: Mercury Contamination,
W74-06014 5B

MOISTURE AVAILABILITY
Growth and Moisture Availability of Shelterbelts in the Kulunda Steppe (Rost i vlagoobespechennost' lesnykh polos v Kulundinskoy stepi),
W74-06301 2G

MOISTURE STRESS
Moisture Stresses in Arizona Mixed Conifer Seedlings,
W74-06461 2I

MOISTURE STRESS (PLANT)
Plant Moisture Stress Patterns in Eurotia lanata and Atriplex confertifolia,
W74-06497 2I

MOLLUSKS
Uptake and Accumulation of an Organochlorine Insecticide (Dieldrin) by an Estuarine Mollusc, Rangia Cuneata,
W74-06031 5C

MONITORING
Monitoring Considerations for Municipal Wastewater Effluent and Sludge Application to the Land,
W74-05984 5D

On Multidisciplinary Research on the Application of Remote Sensing to Water Resources Problems,
W74-05988 7B

Pesticides in Selected Western Streams - 1968-71,
W74-06062 5A

A Computer-Based Telecontrol and Communications System for a Water Supply Network,
W74-06146 7C

Pollution Analyzers for Air and Water-Who makes What,
W74-06153 5A

Water Quality Report--Stillaguamish River, December 1970-September 1971,
W74-06273 5B

MONTANA
Geology and Water Resources of Eastern Part of Judith Basin, Montana,
W74-06263 2F

Appraisal of the Quality of Ground Water in the Helena Valley, Montana,
W74-06269 2F

Impacts of Induced Rainfall on the Great Plains of Montana.
W74-06442 3B

Ecological Impacts: Part 1--Range and Range Livestock production,
W74-06443 3B

Ecological Impacts: Part II--Wildlife and Biocommunities,
W74-06444 3B

Agricultural Impacts,
W74-06445 3B

Hydrology Impacts: Part I--Ground Water Hydrology,
W74-06446 3B

Hydrology: Part II--Surface Hydrology and Geomorphology,
W74-06447 3B

MONTMORILLONITE
Determination of Montmorillonite in Small Samples and Implications for Suspended-Matter Studies,
W74-06285 2J

MOROCCO (OUALIDIA LAGOON)
A Bacteriological Study of the Oyster Beds and Shellfish of the Lagoon of Oualidia During 1970, (In French),
W74-06252 5C

MORTALITY
Endrin Uptake and Release by Fingerling Channel Catfish (Ictalurus Punctatus),
W74-06060 5C

MOSSBAUER EFFECT
Characterisation and Magnetic Properties of Natural Ferric Gel,
W74-05992 2K

MOUNTAIN REGIONS
Moistening of Mountain Light-Chestnut Soils of Extracontinental Regions of Tien-Shan and Altai Mountains, (In Russian),
W74-06341 2G

MOUNTAINS
Mapping of Suspended-Sediment Discharge in Complex Atlases (Kartografirovaniye stoka vzveshennykh nanosov v kompleksnykh atlasakh),
W74-06452 2J

MOVEMENT
Water Exchange in Lake Baykal (O vodoobmene v oz. Baykal),
W74-06306 2H

MUD CRAB
Physiological Response of the Mud Crab, Eurypanopeus Depressus to Cadmium,
W74-06126 5C

MULTIELEMENT ANALYSIS
Multielement Instrumental Neutron Activation Analysis of Biological Tissue Using a Single Comparator Standard and Data Processing by Computer,
W74-06022 5A

MULTIPLE PURPOSE PROJECTOR
Multiple Planning for Multipurpose Water Resource Systems: A Structure for Regional Water Resource Development,
W74-06106 6B

MULTIPLE-PURPOSE PROJECTS
Little Creek Watershed Project, Laurens and Wheeler Counties, Georgia (Final Environmental Impact Statement).
W74-05996 4D

An Approach to Evaluation in Multiple Objective River Basin Planning, An Analysis of Selected Water Quantity Alternatives in the Okanagan Valley, British Columbia, Canada,
W74-06425 6A

MULTIVARIATE ANALYSIS
Multivariate Approaches to Algal Stratagems and Tactics in Systems Analysis of Phytoplankton.
W74-06047 5C

MUNG-WHEAT ROTATION
Encouraging Residual Effect of Phosphorus on Wheat with One Irrigation,
W74-06496 3F

MUNICIPAL WASTES
Ozone Disinfection of Industrial-Municipal Secondary Effluents,
W74-06159 5D

MUNICIPAL WATER
Lake Erie, Ohio, Pennsylvania, New York Intake Water Quality Summary, 1970.
W74-05987 5B

MUSKEGON COUNTY (MICH)
Some Experiences in Land Acquisition for a Land Disposal System for Sewage Effluent,
W74-05966 5D

MUSSELS
Mussels and Indicators of Biological Recovery Zone,
W74-06158 5C

MUTANTS
Defects in Prodigiosin Formation by L-Forms of Serratia Marcescens.
W74-06099 5A

MYSIDS
The Biology of Mysids Acclimatized in the Reservoirs of the Volga River,
W74-06017 2H

MYSIS-RELICTA
Growth , Life History, and Respiration of Mysis relicta in an Arctic and Temperate Lake.
W74-06500 2H

NAEGLERIA-SPP
A Method for the Isolation of Naegleria Species from Water Samples,
W74-06068 5C

NANNOPLAKTON
Diel and Annual Cycles of Net Plankton Photosynthesis in Lake Ontario,
W74-06083 5C

NANNOPLANKTON
Seasonal Changes in Organic Nitrogen Content of Net-and Nannophytoplankton in Two Hardwater Lakes,
W74-06495 5C

NAPHTHOLS
Metabolism of Selected Pesticides by Marine Microorganisms,
W74-06066 5C

NARRAGANSETT BAY (R
Ecology of Small Boat Marinas,
W74-06074 5C

NASSAU RIVER ESTUARY (FLA)
A Bill to Authorize the Establishment of the Florida Frontier Historic Riverway, and for other Purposes.
W74-06217 6E

NATIONAL ENVIRONMENTAL POLICY ACT
EPA Review of the EIS,
W74-06110 6G

NATIONAL PARKS
Proposed Big Cypress Reserve, Florida.
W74-06005 6E

NATURAL RESOURCES
Department of Fish and Wildlife.
W74-06328 6E

NAVIGATION
Navigation--Boating Safety and Regulations.
W74-06220 6E

NEBRASKA
Ground Water Problem at Niobrara, Nebraska and the Niobrara State Park (Final Environmental Statement).
W74-06001 4A

NEGEV DESERT
Stomatal Responses to Changes in Humidity in Plants Growing in the Desert,
W74-06241 2I

NEMATOCIDES
Bionomics and Integrated Control of Plant Parasitic Nematodes,
W74-06336 5B

NEMATODES
Bionomics and Integrated Control of Plant Parasitic Nematodes,
W74-06336 5B

NERVE GAS GB (SARIN)
Properties of GB in Water,
W74-06161 5B

NETHERLANDS
The Distribution of Asellus Aquaticus (L.) and Proasellus Meridianus (RAC.) in the Southwestern Part of the Netherlands,
W74-06051 5C

NETS
Can Halobates Dodge Nets. I: By Daylight.,
W74-06117 2I

NETWORK DESIGN
A Computer-Based Telecontrol and Communications System for a Water Supply Network,
W74-06146 7C

NEUTRON ACTIVATION ANALYSIS
Multielement Instrumental Neutron Activation Analysis of Biological Tissue Using a Single Comparator Standard and Data Processing by Computer,
W74-06022 5A

Arsenic and Antimony in Laundry Aids by Instrumental Neutron Activation Analysis,
W74-06030 5A

NEVADA (PYRAMID LAKE)
Reproductive Characteristics of the Cui-ui Lakesucker (Chasmistes cujus Cope) and Its Spawning Behavior in Pyramid Lake, Nevada,
W74-05999 2H

NEW HAMPSHIRE
Restrictions on Structures Built Over State Waters.
W74-06185 6E

NEW MEXICO
An Analytical Interdisciplinary Evaluation of the Utilization of the Water Resources of the Rio Grande in New Mexico: Socorro Region,
W74-06103 6B

Flood of July 17, 1972 in Gallup, New Mexico,
W74-06267 2E

Flood of September 3, 1972, in Hillsboro, New Mexico,
W74-06299 2E

NEW YORK
Lake Erie, Ohio, Pennsylvania, New York Intake Water Quality Summary, 1970.
W74-05987 5B

The Acute Toxicity of Some Heavy Metal Ions toward Benthic Organisms,
W74-06035 5C

Water Power.
W74-06182 6E

Regional Water Planning and Development.
W74-06183 6E

Powers and Duties of Department of Fish and Wildlife.
W74-06184 6E

Helms V. Diamond (Appeal from Agency Order Prohibiting Landing of Seaplanes on Bodies of Water Within Forest Preserve).
W74-06188 6E

Buffalo Harbor, New York (Maintenance), (Final Environmental Impact Statement).
W74-06197 8A

Discharge of Sewage into Waters.
W74-06199 6E

River Improvement.
W74-06200 6E

Department of Fish and Wildlife.
W74-06328 6E

NEW YORK BIGHT
Trace Metals in Sediments of New York Bight,
W74-06012 5A

NEW ZEALAND
World's Largest Deep Aerated Stabilization Basin in New Zealand,
W74-06401 5D

NEW ZEALAND (WESTLAND)
Management of Protection Forests in Westland,
W74-06488 4A

NICKEL
Transfer of Heavy Metal Pollutants from Lake Erie Bottom Sediments to the Overlying Water,
W74-05956 5B

NITRATES
Algal Assays of Archipelago Waters. Quantitative Aspects,
W74-06015 5C

Studies with Dithizone. Part XXX. Complexes of Metals, with S-Methyldithizone and the Methylation of Metal Dithizonates,
W74-06122 5A

Nutrient-Productivity Relationships in a Bayou Estuary,
W74-06160 5C

Nitrate-Nitrogen and Phosphorus Contents of Streams Draining Small Agricultural Watersheds in Kentucky,
W74-06265 5B

Nitrogen Tracers in Nitrogen Cycle Studies -- Past Use and Future Needs,
W74-06339 5B

Nitrogen-15 Enrichment of Soils and Soil-Derived Nitrate,
W74-06349 5B

Nitrates and Ground-Water Management in the Fresno Urban Area,
W74-06367 5B

NITRIFICATION
Indications of Disturbances in the Nitrification Process in a Heavily Nitrogen-Polluted Water Body,
W74-06044 5C

Nitrification and Denitrification Facilities,
W74-06274 5D

NITRILOTRIACETIC ACID
Mobilization of Some Metals in Water and Animal Tissue by NTA, EDTA and TPP,
W74-06173 5B

NITRITES
Nutrient-Productivity Relationships in a Bayou Estuary,
W74-06160 5C

NITROGEN
Nitrogen Budget of a North Carolina Estuary,
W74-05954 5C

Nitrogen and Phosphorus Release from Decaying Water Milfoil,
W74-06018 5C

Criteria for Estimating Limiting Nutrients in Natural Streams,
W74-06105 5C

Effect of Some Forms of Nitrogen Fertilizers on the Development and Chemical Composition of the Flue Cured Tobacco at Different Soil Moisture, (In Polish),
W74-06137 3F

Carbon and Nitrogen as Regulators of Algal Growth,
W74-06166 5C

Water Quality Report--Stillaguamish River, December 1970-September 1971,
W74-06273 5B

Nitrogen and Phosphorus Composition of Surface Runoff as Affected by Tillage Method,
W74-06344 5B

Nitrogen Losses in Surface Runoff from Agricultural Watersheds on Missouri Valley Loess,
W74-06345 5B

Nitrogen-15 Enrichment of Soils and Soil-Derived Nitrate,
W74-06349 5B

Nutrient Enrichment and Control Requirements in the Upper Chesapeake Bay, Summary and Conclusions,
W74-06352 5C

Physical-Chemical Nitrogen Removal from Municipal Wastewater,
W74-06355 5D

Chemical Pollution of Ground Waters,
W74-06365 5B

NITROGEN-15
Nitrogen-15 Enrichment of Soils and Soil-Derived Nitrate,
W74-06349 5B

NITROGEN COMPOUNDS
Nitrogen Tracers in Nitrogen Cycle Studies -- Past Use and Future Needs,
W74-06339 5B

NITROGEN CYCLE
Nitrogen Tracers in Nitrogen Cycle Studies -- Past Use and Future Needs,
W74-06339 5B

NITROGEN FIXING BACTERIA
Indications of Disturbances in the Nitrification Process in a Heavily Nitrogen-Polluted Water Body,
W74-06044 5C

NITROSAMINES
Possible Microbial Contribution to Nitrosamine Formation in Sewage and Soil,
W74-06136 5B

NODULES
Influence of Development in Vicia villosa and Vicia sativa by Their Nodules and by Climatic Conditions: I. Development of Nodules in Vicia villosa and in Vicia sativa During Vegetative Period, (In German),
W74-06240 2I

NORTH CAROLINA
Public Participation in Water Pollution Control Policy and Decision Making,
W74-05953 6A

Nitrogen Budget of a North Carolina Estuary,
W74-05954 5C

Oil Terminal Facilities.
W74-06187 6E

Floodway Regulations.
W74-06189 6E

Well Construction Act.
W74-06190 6E

Solid Waste Disposal.
W74-06191 6E

Rucker V. Willis (Suit to Enjoin Construction).
W74-06230 6E

NORTH DAKOTA
Burnt Creek RC and D Measure for Flood Prevention (Final Environmental Statement).
W74-06002 4A

The Optimum Development of Water Resources in a Rural Setting,
W74-06422 4A

NORTH SEA
Trace Metals in the North Sea,
W74-06011 5A

Pollution of the North Sea,
W74-06023 5B

NORTH SEA (SKAGERRAK)
Carbonate Cementation in Coralline Algal Nodules in the Skagerrak, North Sea: Biochemical Precipitation in Undersaturated Waters,
W74-06294 2J

NORWAY (BORGENFJORDEN)
Spawning, Larval Settlement, Growth, Biomass, and Distribution of Ciona intestinalis L. (Tunicata) in Borgenfjorden, North-Trondelag, Norway,
W74-06417 2L

NUCLEAR ENERGY
The Search for Tomorrow's Power,

Oil and Gas Seeps of the Northern Gulf of Alaska,
W74-06432 5B

OIL TERMINAL FACILITIES
Oil Terminal Facilities.
W74-06187 6E

OIL WASTES
Biodegradation of Oil,
W74-06076 5B

Crawling and Respiration as Indices of Sublethal Effects of Oil and A Dispersant on an Intertidal Snail Littorina Littorea,
W74-06084 5C

OIL-WATER INTERFACES
Thermal Death of a Hydrocarbon Bacterium in a Nonaqueous Fluid,
W74-06098 5C

OKANAGAN RIVER VALLEY (BRITISH COLUMBIA)
An Approach to Evaluation in Multiple Objective River Basin Planning, An Analysis of Selected Water Quantity Alternatives in the Okanagan Valley, British Columbia, Canada,
W74-06425 6A

OKLAHOMA
A Multilayer Aquifer Model of the Ogallala Formation in Oklahoma,
W74-05962 2F

Water Quality Effects of Seepage from Earthen Dams,
W74-06453 5B

ON-SITE TESTS
Evaluation of Existing Field Test Kits for Determining Free Chlorine Residuals in Aqueous Solutions,
W74-06162 5A

ONCHOCERCIASIS
Incidence of, and Beliefs About, Onchocerciasis in the Senegal River Basin,
W74-06231 5C

OPERATING COSTS
Pulp and Paper Mill Sludge Disposal by Combustion,
W74-06397 5D

OPOSSIUM SHRIMP
The Biology of Mysids Acclimatized in the Reservoirs of the Volga River,
W74-06017 2H

OPTIMIZATION
Biological Wastewater Treatment System Design. Part I. Optimal Synthesis,
W74-06407 5D

Biological Wastewater Treatment System Design. Part II. Effects of Parameter Variations on Optimal Process System Structure and Design,
W74-06408 5D

Sequential Deterministic Optimization in Reservoir Operation,
W74-06416 4A

OPTIMUM DEVELOPMENT PLANS
Water Quality Simulation and Application,
W74-06419 5B

The Optimum Development of Water Resources in a Rural Setting,
W74-06422 4A

OREGON
Highways and Environment,
W74-06114 6G

A Framework for Local Participation and Decision-Making,
W74-06116 6G

Lakes of Oregon: Volume One, Clatsop, Columbia, and Tillamook Counties,
W74-06270 2H

ORGANIC MATTER
Organics,
W74-05974 5D

An Inexpensive Titration Method for the Determination of Organic Carbon in Recent Sediments,
W74-06284 5A

Long-Term Effects of Manure, Fertilizer, and Plow Depth on Chemical Properties of Soils and Nutrient Movement in a Monoculture Corn System,
W74-06346 5B

ORGANIC NITROGEN
Seasonal Changes in Organic Nitrogen Content of Net-and Nannophytoplankton in Two Hardwater Lakes,
W74-06495 5C

ORGANOPHOSPHORUS PESTICIDES
Detection of Organophosphorous Pesticides by in Situ Fluorometry on Thin-Layer Chromatograms,
W74-06025 5A

OROGRAPHY
The Coastal Desert of Chile,
W74-06473 2B

ORTHOPHOSPHATES
Response of Anabaena to pH, Carbon, and Phosphorus,
W74-06165 5C

OSTRACODS
Acute Toxicities of Antimycin A, Bayer 73, and TFM to the Ostracod Cypretta Kawatai,
W74-06039 5C

OSTRACODS (FRESHWATER)
Contributions to the Knowledge About the Biology and Ecology of Freshwater Ostracods From the Neighborhood of Hamburg, (in German),
W74-06420 2H

OXIDATION
Liquid-Phase Oxidation of Phenol, Methanol, and Formaldehyde for Purification of Industrial Effluents (Zhidkofaznoe okislenie fenola, metanola i formal'degida primenitel'no k ochistke stochnykh vod),
W74-06403 5D

OXIDATION LAGOONS
World's Largest Deep Aerated Stabilization Basin in New Zealand,
W74-06401 5D

OXIDATION-REDUCTION POTENTIAL
Oxidation-Reduction Potential and Growth of Salmonella and Pseudomonas Fluorescens,
W74-06134 5C

OXYGEN CONSUMPTION
The Oxygen Consumption of Mayfly (Ephemeroptera) and Stonefly (Plecoptera) Larvae at Different Oxygen Concentration,
W74-06019 5C

Oxygen Consumption of Limnocalanus Macrurus Sars (Calanoida, Copepoda) in Relation to Environmental Conditions,
W74-06029 5C

Physiological Response of the Mud Crab, Eurypanopeus Depressus to Cadmium,
W74-06126 5C

OXYGEN DEMAND
The Oxygen Consumption of Mayfly (Ephemeroptera) and Stonefly (Plecoptera) Larvae at Different Oxygen Concentration,
W74-06019 5C

Benthic Oxygen Demands of Houston Ship Channel Sediments,
W74-06073 5C

OYSTER BEDS
A Bacteriological Study of the Oyster Beds and Shellfish of the Lagoon of Oualidia During 1970, (In French),
W74-06252 5C

OYSTER POPULATIONS
A Parasitic Sporozoan of Crassostrea rhizophorae (Guilding), (In French),
W74-06253 5C

OYSTERS
Oysters: Retention and Excretion of Three Types of Human Waterborne Disease Bacteria,
W74-06167 5C

OZONATION
Inactivation of Poliovirus in Water by Ozonation,
W74-06156 5D

OZONE
Salinity-Ozone Interactive Effects on Yield and Water Relations of Pinto Bean,
W74-06070 3C

Ozone Disinfection of Industrial-Municipal Secondary Effluents,
W74-06159 5D

Interactive Effects of Salinity and Ozone on Growth and Yield of Garden Beet,
W74-06342 3C

PACIFIC NORTHWEST
The Columbia Interstate Compact: Politics of Water Resources in the Pacific Northwest,
W74-05957 6E

PACIFIC OCEAN
Transient Excess-Radon Profiles in Pacific Bottom Water,
W74-05990 2K

Helium Isotopes in Ocean Sediments (Izotopy geliya v osadkakh okeanov),
W74-06307 2J

A Review of the Oceanography and Renewable Resources of the Northern Gulf of Alaska.
W74-06426 2L

A Review of the Biological Oceanography of the Northeast Pacific Ocean,
W74-06429 2L

The Intertidal Region of the Gulf of Alaska,
W74-06430 2L

Coastal Weather, Tides and Wind Waves of the Northern Gulf of Alaska,
W74-06431 2L

Oil and Gas Seeps of the Northern Gulf of Alaska,
W74-06432 5B

PALEOCLIMATOLOGY
Dendroclimatic History of Southwestern United States,
W74-06290 2B

The Plio-Quaternary Climatic Changes Along the Semiarid Seaboard of Chile,
W74-06478 2B

PAMLICO RIVER ESTUARY (NO
Nitrogen Budget of a North Carolina Estuary,
W74-05954 5C

PARAFFIN WAX
Wax-Treated Soils for Harvesting Water,
W74-06457 3B

PARASITISM
Bionomics and Integrated Control of Plant Parasitic Nematodes,
W74-06336 5B

PARTICLE SHAPE
Detrital Quartz as a Natural Tracer-Fourier Grain Shape Analysis,
W74-06293 2J

PARTICLE VELOCITIES
The Kinematics of Water Particle Velocities of Breaking Waves Within the Surf Zone,
W74-06314 2J

PASTURES
Yield Determinations in Permanent Pastures at Different Locations: Interactions Between Location and Manuring Intensity, (In German),
W74-06251 3F

PATENTS
Process for Recovering Forest Product Plant Wastes,
W74-06378 5D

PATH OF POLLUTANTS
Land Treatment of Liquid Waste: The Hydrologic System,
W74-05975 5D

On Multidisciplinary Research on the Application of Remote Sensing to Water Resources Problems,
W74-05988 7B

The Residence Time of Thorium in Surface Sea Water and Its Implications Regarding the Rate of Reactive Pollutants,
W74-05995 5B

System Simulation to Identify Environmental Research Needs: Mercury Contamination,
W74-06014 5B

Relationships Between Levels of Radiocesium in Dominant Plants and Arthropods in a Contaminated Streambed Community,
W74-06016 5C

Methyl Mercury Accumulation in an Aquatic Food Chain. A Model and some Implications for Research Planning,
W74-06042 5B

Accumulation and Movement of Mirex in Selected Estuaries of South Carolina, 1969-71,
W74-06054 5B

Factors Affecting the Behavior of Five Chlorinated Hydrocarbons in Two Natural Waters and Their Sediments,
W74-06064 5B

The Fate of Dieldrin in a Model Ecosystem,

Mobilization of Some Metals in Water and Animal Tissue by NTA, EDTA and TPP,
W74-06173 5B

Alluvial Ground Water Quality Alteration as Related to Solid Waste Disposal Sites in Iowa, Part I: Text; Part II: Appendix,
W74-06256 5B

Distribution of Radionuclides in the Columbia River Streambed from the Nuclear Reactors, Hanford Reservation to Longview, Washington,
W74-06272 5B

Ground Water Pollution from Subsurface Excavations: Part 1. Source Identification and Evaluation.
W74-06277 5B

Chemical Pollution of Ground Waters,
W74-06365 5B

Water Quality and Other Aspects of Ground-Water Recharge in Southern California,
W74-06366 5B

PATHOGENIC BACTERIA
Methodology for Recovery and Identification of Enteropathogenic Escherichia Coli.
W74-06151 5A

PATHOGENICITY
A Method for the Isolation of Naegleria Species from Water Samples,
W74-06068 5C

PECTIN
A Preliminary Note on the Sequential Decomposition of Pectin by Aquatic Bacteria,
W74-06092 5B

PENNSYLVANIA
Riverine Recreational Development--Mathematical Modeling,
W74-05958 5B

Lake Erie, Ohio, Pennsylvania, New York Intake Water Quality Summary, 1970.
W74-05987 5B

Some Characteristics of an Oscillatoria-Dominated Metalimnetic Phytoplankton Community,
W74-06081 5C

Land and Water Conservation and Reclamation.
W74-06186 6E

Physical, Chemical, and Biological Characteristics of Conewago Lake Drainage Basin, York County, Pennsylvania,
W74-06259 5C

Water Quality Maintenance,
W74-06330 5G

Flood of September 1971 in Southeastern Pennsylvania,
W74-06354 2E

Application of Multispectral Remote Sensing to Soil Survey Research in Southeastern Pennsylvania,
W74-06494 7B

PEPTIDES
Self-Purification and Ciliate Colonization in Acid Environment (Model Experiment), (Selbstreinigung und Ciliatenbesiedlung in saurem Milieu (Modellversuche),
W74-06020 5C

PEPTONE DECOMPOSITION
Self-Purification and Ciliate Colonization in Acid Environment (Model Experiment), (Selbstreinigung und Ciliatenbesiedlung in saurem Milieu (Modellversuche),
W74-06020 5C

PERIPHYTON
Changes in Periphytic Algae Following Bicarbonate Additions to a Small Stream,
W74-06087 5C

PERMAFROST
Permafrost: Relation Between Ice Content and Dielectric Losses at 100 Deg K.
W74-05994 2C

PERMITS
Floodway Regulations.
W74-06189 6E

Kreshtool v. Delmarva Power and Light Co. (Permit to Construct Electric Generating Unit in Coastal Zone)
W74-06201 6E

National Pollutant Discharge Elimination System.
W74-06223 6E

PERU
Aquacultural Developments in Peru,
W74-06353 3F

On the Causes of Aridity Along a Selected Group of Coasts,
W74-06469 2B

New Evidence on the Climatic Controls Along the Peruvian Coasts,
W74-06471 6B

Distinctive Hydrogeological Characteristics of Some Pampas of the Peruvian Coastal Region,
W74-06472 4B

PESTICIDE KINETICS
Factors Affecting the Behavior of Five Chlorinated Hydrocarbons in Two Natural Waters and Their Sediments,
W74-06064 5B

PESTICIDE REMOVAL
Chemical and Sediment Movement from Agricultural Land into Lake Erie, Supplement Report,
W74-05955 5B

PESTICIDE RESIDUES
Pollution Studies in the Clyde Sea Area,
W74-06049 5C

Pesticide Residues in Natural Fish Populations of the Smoky Hill River of Western Kansas - 1967-69, 10H. E. Klaassen, and
W74-06052 5A

International Cooperative Study of Organochlorine and Mercury Residues in Wildlife, 1969-71,
W74-06053 5A

Accumulation and Movement of Mirex in Selected Estuaries of South Carolina, 1969-71,
W74-06054 5B

Occurrence of DDT Residues in Beluga Whales (Delphinapterus Leucas) From the Mackenzie Delta, N.W.T.,
W74-06061 5A

A Solvent-Saving Extraction-Evaporation Apparatus Developed for Residue Analysis of Pesticides,
W74-06089 5A

Determination of Residues of Mesurol and its Toxic Metabolites in Plant and Animal Tissues,
W74-06128 5A

PESTICIDE TOXICITY
2, 4, 5-T,
W74-06027 5C

Acute Toxicities of Antimycin A, Bayer 73, and TFM to the Ostracod Cypretta Kawatai,
W74-06039 5C

Captain Toxicity to Fathead Minnows (Pimephales Promelas), Bluegills (Lepomis Macrochirus), and Brook Trout (Salvelinus Fontinalis),
W74-06085 5C

PESTICIDES
Mirex Incorporation in the Environment: Toxicity in Selected Freshwater Organisms,
W74-06032 5C

Pesticides in Effluents and Polluted River Water,
W74-06130 5A

Chemical Pollution of Ground Waters,
W74-06365 5B

PESTICIDES RESIDUES
The Fate of Dieldrin in a Model Ecosystem,
W74-06170 5B

PESTICIDES TOXICITY
Biological Effects of Fenitrothion in the Diet of Brook Trout,
W74-06169 5C

PHENOLS
Chromatographic Determination of Dihydric Phenols in Waste Water (Stanoveni Obsahu dvojmocnych fenolu v odpadnich vodach pomoci chromatografie),
W74-06396 5A

Phenolic Compounds in Spent Pulping Liquors and Pulp Mill Effluents (Zwiazki fenolowe w lugach i sciekach z celulozowni),
W74-06400 5A

Liquid-Phase Oxidation of Phenol, Methanol, and Formaldehyde for Purification of Industrial Effluents (Zhidkofaznoe okislenie fenola, metanola i formal'degida primenitel'no k ochistke stochnykh vod),
W74-06403 5D

Screening and Selection of Solvents for Extraction of Phenol from Water,
W74-06410 5D

PHILODINA ROSEOLA
Temperature and the Toxicity of Chromate and Arsenate to the Rotifer, Philodina Roseola,
W74-06172 5C

PHOENIX (ARIZ)
Renovating Municipal Wastewater by High-Rate Infiltration for Ground-Water Recharge,
W74-06364 5D

PHOSPHATES
Algal Assays of Archipelago Waters. Quantitative Aspects,
W74-06015 5C

Luxury Uptake of Phosphate by Activated Sludge,
W74-06157 5D

Nutrient-Productivity Relationships in a Bayou Estuary,
W74-06160 5C

Water Quality Report--Stillaguamish River, December 1970-September 1971,
W74-06273 5B

Contribution to the Study of the Action of Water-Soluble and Citrate-Soluble Phosphoric Under Acids Different Moisture Conditions, (In Serbo-Croation),
W74-06315 3C

PHOSPHOLIPIDS
Occurrence of Phosphonosphingolipids in Bdellovibrio Bacteriovorus Strain UKi2,
W74-06097 5A

PHOSPHORIC ACIDS
Contribution to the Study of the Action of Water-Soluble and Citrate-Soluble Phosphoric Under Acids Different Moisture Conditions, (In Serbo-Croation),
W74-06315 3C

PHOSPHORUS
Nitrogen and Phosphorus Release from Decaying Water Milfoil,
W74-06018 5C

Criteria for Estimating Limiting Nutrients in Natural Streams,
W74-06105 5C

Response of Anabaena to pH, Carbon, and Phosphorus,
W74-06165 5C

Nitrate-Nitrogen and Phosphorus Contents of Streams Draining Small Agricultural Watersheds in Kentucky,
W74-06265 5B

Nitrogen and Phosphorus Composition of Surface Runoff as Affected by Tillage Method,
W74-06344 5B

Nutrient Enrichment and Control Requirements in the Upper Chesapeake Bay, Summary and Conclusions,
W74-06352 5C

PHOSPHORUS-32
Water Metabolism and Dynamics of Labeled Phosphorus in Apple Leaves, (In Russian),
W74-06245 3F

PHOSPHORUS RESIDUALS
Encouraging Residual Effect of Phosphorus on Wheat with One Irrigation,
W74-06496 3F

PHOSPHOTHIOATE PESTICIDES
Pesticides in Selected Western Streams - 1968-71,
W74-06062 5A

Pesticides in Effluents and Polluted River Water,
W74-06130 5A

PHOTODECOMPOSITION
Photodecomposition of Chlorinated Biphenyls and Dibenzofurans,
W74-06125 5B

PHOTOSYNTHESIS
Diel and Annual Cycles of Net Plankton Photosynthesis in Lake Ontario,
W74-06083 5C

Net Assimilation, Water Use and Microclimate of a Maize Canopy: III. Spectral Composition of the Light Inside the Crop, (In French),
W74-06239 3F

Effect of Water Deficiency and Light Regime on Photosynthetic Activity of Leaves, (In Russian),
W74-06246 2I

PHOTOSYNTHETIC RATES
Light Intensity and Photosynthetic Rates in Phytoplankton,
W74-06082 5C

PHTHALATES
Determination of Phthalates in Biological Samples,
W74-06129 5A

POTENTIOMETRY
Automation of Direct Potentiometry,
W74-06133 5A

PRECIPITATION (ATMOSPHERIC)
Tables and Conversions for Microclimatology,
W74-06389 2B

Mean Precipitation-Hours for the Conterminous United States,
W74-06390 2B

PREDATOR-PREY RELATIONSHIP
Influence of Appearance of Prey and Satiation of Predator on Food Selection by Northern Pike (Essox lucius),
W74-06102 8I

PRICES
Recent Adjustments in Water Use and Treatment by U.S. Manufacturers,
W74-06395 5D

PRIMARY PRODUCTIVITY
Enriching Effects of Urban Runoff on the Productivity of a Mesotrophic Lake,
W74-06080 5C

Nutrient-Productivity Relationships in a Bayou Estuary,
W74-06160 5C

PROASELLUS MERIDIANUS
The Distribution of Asellus Aquaticus (L.) and Proasellus Meridianus (RAC.) in the Southwestern Part of the Netherlands,
W74-06051 5C

PROBABILITY COMPUTERS
'Control by Variance' with the Probability Computer,
W74-06152 7C

PROCESS CONTROLLERS
Process Controllers: A Case of Pneumatic-Electronic Coexistence,
W74-06143 7B

PROCESS VARIABLES
'Control by Variance' with the Probability Computer,
W74-06152 7C

PRODIGIOSIN
Defects in Prodigiosin Formation by L-Forms of Serratia Marcescens,
W74-06099 5A

PRODUCTIVITY
Multivariate Approaches to Algal Stratagems and Tactics in Systems Analysis of Phytoplankton,
W74-06047 5C

Ecology of Small Boat Marinas,
W74-06074 5C

Estimating Accuracy for Calculating Production and Elimination of Planktonic Crustaceans Using Eudiaptomus gracilis in Lake Krasavitsa as an Example, (In Russian),
W74-06249 2H

Biomass and Biological Productivity of the Most Typical Plant Communities of Lower Vakhsh, (in Russian),
W74-06423 2I

A Review of the Biological Oceanography of the Northeast Pacific Ocean,
W74-06429 2L

The Intertidal Region of the Gulf of Alaska,
W74-06430 2L

Seasonal Changes in Organic Nitrogen Content of Net-and Nannophytoplankton in Two Hardwater Lakes,
W74-06495 5C

PROGRAMMING MODELS
Applicability of Programming Models to Pricing and Risk Control in Water Resource Management,
W74-06104 6A

PROJECT PLANNING
A Planning Concept for the Georgia Coastal Zone.
W74-05998 2L

Water Resources Development--1973.
W74-06007 6E

How Effective are Environmental Impact Statements.
W74-06107 6G

What Is an Environmental Impact Statement,
W74-06108 6G

EPA Review of the EIS,
W74-06110 6G

The Bureau of Reclamation and Resource Development,
W74-06112 6G

Environmental Policies of the Corps of Engineers,
W74-06113 6G

Highways and Environment,
W74-06114 6G

A Bill to Create an Upper Mississippi River Recreational Area.
W74-06175 6E

PROSOPIUM-COULTERI
New Complexities in Zoogeography and Taxonomy of the Pygmy Whitefish (Prosopium coulteri),
W74-06498 2H

PROTEINS
Lipopolysaccharide and Proteins of the Cell Envelope of Vibrio Marinus, A Marine Bacterium,
W74-06028 5A

Influence of Salinity on Protein Requirements of Rainbow Trout (Salmo Gairdneri) Fingerlings,
W74-06086 5C

PROTOZOA
Self-Purification and Ciliate Colonization in Acid Environment (Model Experiment), (Selbstreinigung und Ciliatenbesiedlung in saurem Milieu (Modellversuche),
W74-06020 5C

PROVENANCE
Sedimentary Reflection of Depositional Environment in the Bardawil Lagoon, Northern Sinai,
W74-06283 2L

Detrital Quartz as a Natural Tracer-Fourier Grain Shape Analysis,
W74-06293 2J

PROXIMITY DETECTORS
Response Time of High-Frequency Oscillator-Type Proximity Detectors,
W74-06144 7B

PSEUDOMONAS
Oxidation-Reduction Potential and Growth of Salmonella and Pseudomonas Fluorescens,
W74-06134 5C

Competitive Growth of Salmonella and Pseudomonads in Tetrathionate Enrichment Broth,
W74-06168 5C

PUBLIC ACCEPTANCE
Public Acceptance--Educational and Informational Needs,
W74-05986 5D

PUBLIC ACCESS
A Bill to Amend the Act of August 3, 1968, Relating to the Nation's Estuaries and Their Natural Resources, to Establish a National Policy with Respect to the Nation's Beach Resources.
W74-06177 6E

PUBLIC HEALTH
Water Pollution Control and Public Water Supply.
W74-06227 6E

Problems in Water Hygiene and Sanitary Protection of Water Bodies in Connection with Urbanization, (In Russian),
W74-06268 5G

PUBLIC RIGHTS
A Bill to Amend the Act of August 3, 1968, Relating to the Nation's Estuaries and Their Natural Resources, to Establish a National Policy with Respect to the Nation's Beach Resources.
W74-06177 6E

A Bill to Declare a National Policy that the Beaches of the United States are Impressed with a National Interest and that the Public Shall have Free and Unrestricted Right to Use Them.
W74-06213 6E

PUBLIC UTILITY DISTRICTS
Water and Sewer System Regulatory Law.

Determination of Phthalates in Biological Samples,
W74-06129 5A

Water Quality Report, Upper Snoqualmie River System, August 1972-November 1972,
W74-06375 5B

SAN FRANCISCO (CALIF)
Flood Prone Areas in the San Francisco Bay Region, California,
W74-06275 7C

SAND BARS
Preliminary Investigations of an Intertidal Sand Body, Cobequid Bay, Bay of Fundy,
W74-06260 2L

SANDS
Detrital Quartz as a Natural Tracer-Fourier Grain Shape Analysis,
W74-06293 2J

Impact of Mining Gravel from Urban Stream Beds in the Southwestern United States,
W74-06374 4C

SANITARY PROTECTION
Problems in Water Hygiene and Sanitary Protection of Water Bodies in Connection with Urbanization, (In Russian),
W74-06268 5G

SATELLITES (ARTIFICIAL)
Snow Surveys from Earth Satellites--A Technical Review of Methods.
W74-06295 7B

ERTS-1 Applications in Hydrology and Water Resources,
W74-06362 7B

SATURATED FLOW
Steady-State Patterns of Rainwater Seeping Through Bedded Soil With and Without Tile Drains,
W74-06257 2G

SCOTLAND (FIRTH OF CLYDE)
Pollution Studies in the Clyde Sea Area,
W74-06049 5C

SCREENS
Can Screened White Water be Recycled to Shower Felts,
W74-06384 5D

SEA WATER
Bomb-Produced Tritium in the Antarctic Ocean,
W74-05993 5B

The Residence Time of Thorium in Surface Sea Water and Its Implications Regarding the Rate of Reactive Pollutants,
W74-05995 5B

Desalted Seawater for Agriculture: It is Economical,
W74-06467 3A

SEASONAL
Diversity in Fresh-Water Phytoplankton,
W74-06057 5C

Seasonal Water Potential Changes in Sonoran Desert Shrubs in Relation to Topography,
W74-06464 2I

SEATTLE (WASH
Water Quality Simulation and Application,
W74-06419 5B

SECRETARY OF NATURAL AND ECONOMIC RESOURCES
Oil Terminal Facilities.
W74-06187 6E

SEDIMENT DISCHARGE
Chemical and Sediment Movement from Agricultural Land into Lake Erie, Supplement Report,
W74-05955 5B

Effects of Meandering on Sediment Discharges and Friction Factors of Alluvial Streams,
W74-06258 2J

Mapping of Suspended-Sediment Discharge in Complex Atlases (Kartografirovaniye stoka vzveshennykh nanosov v kompleksnykh atlasakh),
W74-06452 2J

SEDIMENT LOAD
Regional Sediment Yield Analysis of Alaska Streams,
W74-06440 2J

SEDIMENT TRANSPORT
Effects of Meandering on Sediment Discharges and Friction Factors of Alluvial Streams,
W74-06258 2J

SEDIMENT-WATER INTERFACES
Ground Water Problem at Niobrara, Nebraska and the Niobrara State Park (Final Environmental Statement).
W74-06001 4A

SEDIMENT YIELD
The Land Hydrology of the South-Central Coastal Zone,
W74-06433 2L

Regional Sediment Yield Analysis of Alaska Streams,
W74-06440 2J

Runoff and Sediment Yields from Runoff Plots on Chained Pinyon-Juniper Sites in Utah,
W74-06460 2J

SEDIMENTARY STRUCTURES
Preliminary Investigations of an Intertidal Sand Body, Cobequid Bay, Bay of Fundy,
W74-06260 2L

SEDIMENTATION
Beach Foreshore Sedimentology and Morphology in the Apostle Islands of Northern Wisconsin,
W74-06281 2J

Sedimentary Reflection of Depositional Environment in the Bardawil Lagoon, Northern Sinai,
W74-06283 2L

Environment, Water and Sediments of Christiansted Harbor, St. Croix,
W74-06292 5C

Geology and Geomorphology of the Central Gulf of Alaska Continental Shelf,
W74-06434 2L

SEDIMENTATION RATES
Transfer of Heavy Metal Pollutants from Lake Erie Bottom Sediments to the Overlying Water,
W74-05956 5B

Sedimentation Rates and Recent Sediment History of Lakes Ontario, Erie and Huron,
W74-06282 2J

The Ionium-Thorium Method of Determination of Absolute Age and Rate of Deposition of Bottom Sediments (K voprosu opredeleniya absolyutnogo vozrasta i skorosti sedimentatsii donnykh otlozheniy ioniy-toriyevym metodom),
W74-06308 2J

SEDIMENTOLOGY
A Re-Examination of the Use of the Silt/Clay Ratios as Indicators of Sedimentary Environments: A Study for Students,
W74-05989 2J

SEDIMENTS
An Inexpensive Titration Method for the Determination of Organic Carbon in Recent Sediments,
W74-06284 5A

Helium Isotopes in Ocean Sediments (Izotopy geliya v osadkakh okeanov),
W74-06307 2J

SEEDLINGS
Moisture Stresses in Arizona Mixed Conifer Seedlings,
W74-06461 2I

SEEPAGE
Ground Water Problem at Niobrara, Nebraska and the Niobrara State Park (Final Environmental Statement).
W74-06001 4A

Steady-State Patterns of Rainwater Seeping Through Bedded Soil With and Without Tile Drains,
W74-06257 2G

Approximate Solution for Unconfined Seepage,
W74-06338 4A

Water Quality Effects of Seepage from Earthen Dams,
W74-06453 5B

SEISMIC DESIGN
Earthquake Response of Gravity Dams Including Reservoir Interaction Effects,
W74-06359 8A

SELECTIVITY
Glass Electrode Responses Interpreted by the Solid State Homogeneous- and Heterogeneous-Site Membrane Potential Theory,
W74-06095 2K

SELF-PURIFICATION
Self-Purification and Ciliate Colonization in Acid Environment (Model Experiment), (Selbstreinigung und Ciliatenbesiedlung in saurem Milieu (Modellversuche),
W74-06020 5C

SEMIARID CLIMATES
The Changing Role of Water in Arid Lands,
W74-06466 6B

SENSITIVITY ANALYSIS
Sensitivity Analysis of a Thunderstorm Rainfall Model,
W74-06101 2B

SEPARATION TECHNIQUES
Determination of Ametrine and Atrazine Residues in Soil by Thin-Layer Chromatography,
W74-06024 5A

A Solvent-Saving Extraction-Evaporation Apparatus Developed for Residue Analysis of Pesticides,
W74-06089 5A

Defects in Prodigiosin Formation by L-Forms of Serratia Marcescens,
W74-06099 5A

Determination of Phthalates in Biological Samples,
W74-06129 5A

Study of Hydrophilic Membranes for Oil-Water Separation,
W74-06360 5D

An Effective Method for the Isolation of Fish-Toxic Organic Solutes from Pulp Mill Effluents,
W74-06382 5D

Dewatering of Biological-Chemical Paper Mill Waste Water Sludge with the 'System Hiller' KHD Centrifuge (Entwaesserung von biologisch-chemischem Papierfabriksabwasser-Schlamm mit der KHD-Zentrifuge 'System Hiller'),
W74-06392 5D

Screening and Selection of Solvents for Extraction of Phenol from Water,
W74-06410 5D

SEROTYPES
Evaluation of Malonate Dulcitol Lysine Iron Agar for Presumptive Identification of Salmonellae,
W74-06150 5A

SERRATIA MARCESCENS
Defects in Prodigiosin Formation by L-Forms of Serratia Marcescens,
W74-06099 5A

SESSILE ALGAE
Changes in Periphytic Algae Following Bicarbonate Additions to a Small Stream,
W74-06087 5C

SEVERN RIVER (ENGLAND)
Survey of the Effect of Ashton Paper Mill Effluent Discharge on the Water of the River Severn,
W74-06414 5C

SEWAGE
Possible Microbial Contribution to Nitrosamine Formation in Sewage and Soil,
W74-06136 5B

Competitive Growth of Salmonella and Pseudomonads in Tetrathionate Enrichment Broth,
W74-06168 5C

Discharge of Sewage into Waters.
W74-06199 6E

Private Sewer Systems.
W74-06226 6E

SEWAGE BACTERIA
Ozone Disinfection of Industrial-Municipal Secondary Effluents,
W74-06159 5D

SEWAGE DISPOSAL
Some Experiences in Land Acquisition for a Land Disposal System for Sewage Effluent,
W74-05966 5D

Recycling Urban Effluents on Land Using Annual Crops,
W74-05980 5D

Recycling Municipal Sludges and Effluents on Land,
W74-05982 5D

Pollution of the North Sea,
W74-06023 5B

Supervision over Local Sanitation.
W74-06218 6E

SEWAGE SLUDGE
Trace Metal Water Pollutants Determined by X-ray fluorescence,
W74-06079 5A

SEWAGE TREATMENT
Solid Waste Disposal.
W74-06191 6E

Supervision over Local Sanitation.
W74-06218 6E

Private Sewer Systems.
W74-06226 6E

Nitrification and Denitrification Facilities,
W74-06274 5D

Airtex Products, Inc. V. Pollution Control Board (An Appeal from an Agency Imposed Fine for Discharge of Cyanides into Sewer System).
W74-06323 6E

Activated Carbon Adsorption and Polishing of Strong Wastewater,
W74-06411 5D

SHALLOW WATER
A Package Program for Time-Stepping Long Waves into Coastal Regions with Application to Haleiwa Harbor, Oahu,
W74-06316 2L

A New Method for Determining Normal Modes of Irregular Bodies of Water with Variable Depth,
W74-06318 2L

Speed of the Solitary Wave,
W74-06320 2J

SHARA DESERT
Climatic-Geomorphological Zones and Land Utilization in the Coastal Deserts of the North Sahara,
W74-06480 4A

SHELTERBELTS
Growth and Moisture Availability of Shelterbelts in the Kulunda Steppe (Rost i vlagoobespechennost' lesnykh polos v Kulundinskoy stepi),
W74-06301 2G

SHIGELLA
Oysters: Retention and Excretion of Three Types of Human Waterborne Disease Bacteria,
W74-06167 5C

SHINERS
Notes on the Upper Lethal Temperature of the Duskystripe Shiner, Notropis Pilsbryi, and the Bluegill, Lepomis macrochirus,
W74-06037 5C

The Effects of Dibrom on Respiratory Activity of the Stonefly, Hydroperla Crosbyi, Hellgrammite, Corydalus Cornutus and the Golden Shiner, Notemigonus Crysoleucas,
W74-06040 5C

SHRIMP
The Biology of Mysids Acclimatized in the Reservoirs of the Volga River,
W74-06017 2H

SHRUBS
Seasonal Water Potential Changes in Sonoran Desert Shrubs in Relation to Topography,
W74-06464 2I

SIALIS
Effects of Acid Mine Drainage on the Stream Ecosystem of the East Fork of the Obey River, Tennessee,
W74-06491 5C

SILICA
NMR Studies of Water Adsorbed on a Number of Silica Surfaces,
W74-06405 2K

SILT-CLAY RATIO
A Re-Examination of the Use of the Silt/Clay Ratios as Indicators of Sedimentary Environments: A Study for Students,
W74-05989 2J

SILTS
A Re-Examination of the Use of the Silt/Clay Ratios as Indicators of Sedimentary Environments: A Study for Students,
W74-05989 2J

SIMULATION ANALYSIS
Riverine Recreational Development--Mathematical Modeling,
W74-05958 5B

Hysteretic Water Flow in a Porous Medium: Experimental Study and Numerical Simulation,
W74-05959 2F

A Computer Program for Earthquake Analysis of Gravity Dams Including Hydrodynamic Interaction,
W74-06280 8A

Numerical Simulation of Tsunamis,
W74-06297 4A

Sequential Deterministic Optimization in Reservoir Operation,
W74-06416 4A

Water Quality Simulation and Application,
W74-06419 5B

The Hydrological Evaluation of Regional Water-Resource Systems in the United Kingdom,
W74-06421 6B

SINAI REGION
Sedimentary Reflection of Depositional Environment in the Bardawil Lagoon, Northern Sinai,
W74-06283 2L

SIPHONS
A Bill to Amend the Project for Flood Protection on Indian Bend Wash, Maricopa County, Arizona, Authorized by the Flood Control Act of 1965.
W74-06178 6E

SIPHONS (FLOW-SPLITTING)
A Simplified Flow-Splitting Chamber and Siphon for Proportional Diluters,
W74-06094 7B

SITKA SPRUCE
Influence of Various Initial Moisture Contents on Decay of Sitka Spruce and Sweetgum Sapwood by Polyporus Versicolor in the Soil-Block Test,
W74-06487 2I

SLUDGE DISPOSAL
Recycling Municipal Sludges and Effluents on Land.
W74-05963 5D

Federal and State Legislative History and Provisions for Land Treatment of Municipal Wastewater Effluents and Sludges,
W74-05964 6E

The properties of Sludges,
W74-05967 5D

A Regional View on the Use of Land for Disposal of Municipal Sewage and Sludge,
W74-05969 5D

The Physical Processes in the Soil as Related to Sewage Sludge Application,
W74-05970 5D

Soil Microbiological Aspects of Recycling Sewage Sludges and Waste Effluents on Land,
W74-05972 5D

Inorganic Reactions of Sewage Wastes with Soils,
W74-05973 5D

Organics,
W74-05974 5D

Land Resources,
W74-05976 5D

Soil-Plant Relationships (Some Practical Considerations in Waste Management),
W74-05977 5D

Crop and Food Chain Effects of Toxic Elements in Sludges and Effluents,
W74-05978 5D

Engineering and Economics of Sludge Handling,
W74-05981 5D

Economic Aspects of the Application of Municipal Wastes to Agricultural Land,
W74-05983 5D

Monitoring Considerations for Municipal Wastewater Effluent and Sludge Application to the Land,
W74-05984 5D

Institutional Options for Recycling Urban Sludges and Effluents on Land,
W74-05985 5D

Public Acceptance--Educational and Informational Needs,
W74-05986 5D

Pulp and Paper Mill Sludge Disposal by Combustion,
W74-06397 5D

Conditioning and Disposal of Solids From Potato Wastewater Treatment,
W74-06486 5D

SLUDGE DISPOSAL FIELDS
Physical Changes to Soils Used for Land Application of Municipal Waste--What Do We Know, What Do We Need to Know,
W74-05971 5D

SLUDGE TREATMENT
Bellmer Converging Double-Belt Press, An Interesting Machine for Sludge Dewatering (Die Bellmer-Winkelpresse, ein interessantes Geraet fuer die Schlammentwaesserung).
W74-06386 5D

Dewatering of Biological-Chemical Paper Mill Waste Water Sludge with the 'System Hiller' KHD Centrifuge (Entwaesserung von biologisch-chemischem Papierfabriksabwasser-Schlamm mit der KHD-Zentrifuge 'System Hiller'),
W74-06392 5D

SMALL WATERSHEDS
Nitrate-Nitrogen and Phosphorus Contents of Streams Draining Small Agricultural Watersheds in Kentucky,
W74-06265 5B

SMOKY HILL RIVER (KAN
Pesticide Residues in Natural Fish Populations of the Smoky Hill River of Western Kansas - 1967-69, 10H. E. Klaassen, and
W74-06052 5A

SNAILS
Crawling and Respiration as Indices of Sublethal Effects of Oil and A Dispersant on an Intertidal Snail Littorina Littorea,
W74-06084 5C

SNOQUALMIE RIVER (WASH)
Water Quality Report, Upper Snoqualmie River System, August 1972-November 1972,
W74-06375 5B

SNOW
Distances of Flowage of Snow Avalanches in the Central and Western Caucasus (Dal'nosti vybrosa snezhnykh lavin na Tsentral'nom i Zapadnom Kavkaze),
W74-06451 2C

SNOW REMOVAL
A Preliminary Assessment of Snowfall Interception in Arizona Ponderosa Pine Forest,
W74-06455 2C

SNOW SURVEYS
Snow Surveys from Earth Satellites--A Technical Review of Methods.
W74-06295 7B

Areal Snow Cover Observations in the Central Rockies, Colorado,
W74-06391 2C

SNOWFALL
A Preliminary Assessment of Snowfall Interception in Arizona Ponderosa Pine Forest,
W74-06455 2C

SNOWMELT
National Weather Service River Forecast System--Snow Accumulation and Ablation Model,
W74-06370 2C

Areal Snow Cover Observations in the Central Rockies, Colorado,
W74-06391 2C

SOCIAL IMPACT
The Crisis of the Saharan Oases,
W74-06481 6B

SOCIAL PARTICIPATION
Public Participation in Water Pollution Control Policy and Decision Making,
W74-05953 6A

SOCIO-ECONOMIC MODELS
An Analytical Interdisciplinary Evaluation of the Utilization of the Water Resources of the Rio Grande in New Mexico: Socorro Region,
W74-06103 6B

SOCKEYE SALMON
Effects of Starvation and Subsequent Feeding on Survival and Growth of Fulton Channel Sockeye Salmon Fry (Oncorhynchus nerka),
W74-06119 8I

SOCORRO REGION (N
An Analytical Interdisciplinary Evaluation of the Utilization of the Water Resources of the Rio Grande in New Mexico: Socorro Region,
W74-06103 6B

SODIUM COMPOUNDS
Changes in Periphytic Algae Following Bicarbonate Additions to a Small Stream,
W74-06087 5C

SODIUM TRIPOLYPHOSPHATE
Mobilization of Some Metals in Water and Animal Tissue by NTA, EDTA and TPP,
W74-06173 5B

SOIL CHEMICAL PROPERTIES
Long-Term Effects of Manure, Fertilizer, and Plow Depth on Chemical Properties of Soils and Nutrient Movement in a Monoculture Corn System,
W74-06346 5B

SOIL DISPOSAL FIELDS
The Physical Processes in the Soil as Related to Sewage Sludge Application,
W74-05970 5D

Inorganic Reactions of Sewage Wastes with Soils,
W74-05973 5D

Organics,
W74-05974 5D

Crop and Food Chain Effects of Toxic Elements in Sludges and Effluents,
W74-05978 5D

Watervliet Paper Completes Waste Water Disposal System.
W74-06415 5D

SOIL GROUPS
Effects of a Genetic Soil Group on Runoff (Vliyaniye geneticheskogo tipa pochvy na stok),
W74-06304 2G

SOIL MICROBIOLOGY
Soil Microbiological Aspects of Recycling Sewage Sludges and Waste Effluents on Land,
W74-05972 5D

SOIL MOISTURE
Effect of Some Forms of Nitrogen Fertilizers on the Development and Chemical Composition of the Flue Cured Tobacco at Different Soil Moisture, (In Polish),
W74-06137 3F

Growth and Moisture Availability of Shelterbelts in the Kulunda Steppe (Rost i vlagoobespechennost' lesnykh polos v Kulundinskoy stepi),
W74-06301 2G

Spatial Variation Patterns of Moisture Content of Irrigated Soil Under Cotton (Zakonomernosti prostranstvennoy izmenchivosti vlazhnosti oroshayemoy pochvy pod khlopchatnikom),
W74-06303 2G

Moistening of Mountain Light-Chestnut Soils of Extracontinental Regions of Tien-Shan and Altai Mountains, (In Russian),
W74-06341 2G

Soil Moisture Patterns on Two Chained Pinyon-Juniper Sites in Utah,
W74-06459 2G

Soil Moisture Response to Spraying Big Sagebrush the Year of Treatment,
W74-06462 2I

Influence of Various Initial Moisture Contents on Decay of Sitka Spruce and Sweetgum Sapwood by Polyporus Versicolor in the Soil-Block Test,
W74-06487 2I

SOIL ORGANIC MATTER
Organics,
W74-05974 5D

SOIL PHYSICAL PROPERTIES
The Physical Processes in the Soil as Related to Sewage Sludge Application,
W74-05970 5D

Physical Changes to Soils Used for Land Application of Municipal Waste--What Do We Know, What Do We Need to Know,
W74-05971 5D

SOIL PHYSICS
Spatial Variation Patterns of Moisture Content of Irrigated Soil Under Cotton (Zakonomernosti prostranstvennoy izmenchivosti vlazhnosti oroshayemoy pochvy pod khlopchatnikom),
W74-06303 2G

SOIL STABILIZATION
Management of Protection Forests in Westland,
W74-06488 4A

SOIL SURFACES
Wax-Treated Soils for Harvesting Water,
W74-06457 3B

SOIL SURVEY
Application of Multispectral Remote Sensing to Soil Survey Research in Southeastern Pennsylvania,
W74-06494 7B

SOIL TEMPERATURE
A Device for Measuring the Average Temperature of Water, Soil, or Air,
W74-06045 5A

SOIL TREATMENT
Wax-Treated Soils for Harvesting Water,
W74-06457 3B

SOIL TREATMENTS
Water Harvesting Efficiencies of Four Soil Surface Treatments,
W74-06463 3B

SOIL WATER MOVEMENT
Hysteretic Water Flow in a Porous Medium: Experimental Study and Numerical Simulation,
W74-05959 2F

Steady-State Patterns of Rainwater Seeping Through Bedded Soil With and Without Tile Drains,
W74-06257 2G

Simulation of Post-Irrigation Moisture Movement,
W74-06335 2G

SOIL-WATER-PLANT RELATIONSHIPS
Soil-Plant Relationships (Some Practical Considerations in Waste Management),
W74-05977 5D

Simulation of Post-Irrigation Moisture Movement,
W74-06335 2G

Seasonal Water Potential Changes in Sonoran Desert Shrubs in Relation to Topography,
W74-06464 2I

SOILS (MAGNETIC PROPERTIES)
Ferruginous Concretions in a Poorly Drained Soil of Alberta,
W74-06485 2G

SOLAR RADIATION
Net Assimilation, Water Use and Microclimate of a Maize Canopy: III. Spectral Composition of the Light Inside the Crop, (In French),
W74-06239 3F

Tables and Conversions for Microclimatology,
W74-06389 2B

SOLID STATE MODELS
Glass Electrode Responses Interpreted by the Solid State Homogeneous- and Heterogeneous-Site Membrane Potential Theory,
W74-06095 2K

SOLID WASTE DISPOSAL
Solid Waste Disposal.
W74-06191 6E

SOLID WASTES
Solid Waste Disposal.
W74-06211 6E

Alluvial Ground Water Quality Alteration as Related to Solid Waste Disposal Sites in Iowa, Part I: Text; Part II: Appendix,
W74-06256 5B

Process for Recovering Forest Product Plant Wastes,
W74-06378 5D

Utilization of Bark Waste,
W74-06379 5A

SOLITARY WAVES
Speed of the Solitary Wave,
W74-06320 2J

SOLVENT EXTRACTIONS
Thin-Layer Chromatographic Analysis of HMX in Water,
W74-06033 5A

Solvent Extraction of Copper (II) and Zinc (II) with 1,5-Diphenylcarbazone,
W74-06088 5A

A Solvent-Saving Extraction-Evaporation Apparatus Developed for Residue Analysis of Pesticides,
W74-06089 5A

Screening and Selection of Solvents for Extraction of Phenol from Water,
W74-06410 5D

SOLVENTS
Screening and Selection of Solvents for Extraction of Phenol from Water,
W74-06410 5D

SONORAN DESERT
Seasonal Water Potential Changes in Sonoran Desert Shrubs in Relation to Topography,
W74-06464 2I

Plastic Oases for Arid Seashores,
W74-06468 3A

SOUTH AFRICA
The utilization of the Namib Desert, Southwest Africa,

Stepper Motors Respond to Direct Digital Command,
W74-06100 7B

STILLAGUAMISH RIVER (WASH)
Water Quality Report--Stillaguamish River, December 1970-September 1971,
W74-06273 5B

STOCK WATER
Floating Sheets of Foam Rubber for Reducing Stock Tank Evaporation,
W74-06458 3B

STOMATAL RESPONSE
Stomatal Responses to Changes in Humidity in Plants Growing in the Desert,
W74-06241 2I

STONEFLIES
The Oxygen Consumption of Mayfly (Ephemeroptera) and Stonefly (Plecoptera) Larvae at Different Oxygen Concentration,
W74-06019 5C

The Effects of Dibrom on Respiratory Activity of the Stonefly, Hydroperla Crosbyi, Hellgrammite, Corydalus Cornutus and the Golden Shiner, Notemigonus Crysoleucas,
W74-06040 5C

STORM RUNOFF
Flood of September 1971 in Southeastern Pennsylvania,
W74-06354 2E

STORM STRUCTURE
Sensitivity Analysis of a Thunderstorm Rainfall Model,
W74-06101 2B

STORMS
A Blocked Minimal Tropical Depression Becomes a Storm of Rare Occurrence,
W74-06357 2B

STRATIGRAPHY
Geophysical Investigations of Washington's Ground Water Resources,
W74-06262 2F

STREAMFLOW
Asynchronous Long-Period Streamflow Fluctuations in the European USSR (Asinkhronnost' mnogoletnikh kolebaniy stoka rek yevropeyskoy territorii SSSR),
W74-06305 2E

STREAMS
A Bill to Amend the Fish and Wildlife Coordination Act to Provide for the Preservation of Natural Game Fish Streams.
W74-06214 6E

STRUCTURAL DESIGN
Restrictions on Structures Built Over State Waters.
W74-06185 6E

STRUCTURES
Restrictions on Structures Built Over State Waters.
W74-06185 6E

Water Quality Effects of Seepage from Earthen Dams,
W74-06453 5B

SUBSTRATE UTILIZATION
Hydrocarbon-Oxidizing Bacteria and Their Possible Use as Controlling Agents of Oil Pollution in the Ocean,
W74-06075 5B

SUBSTRATES
Influence of Environmental Experience on Response of Yearling Rainbow Trout (Salmo Gairdneri) to a Black and White Substrate,
W74-06063 5C

SUBSURFACE WATERS
On Water Resource Conditions in the Vicinity of Pinellas County's Eldridge Wilde Well Field,
W74-06232 4B

SUCCESSION
Succession in Benthic Macrofauna in a Swedish Fjord Subsequent to the Closure of a Sulphite Pulp Mill,
W74-06013 5C

SULFATE SOILS
Results of the Washing of Soils of Aleisk Irrigation System by Mineralized Waters (In Russian),
W74-06404 3C

SULFATES
Effect of Water Hardness on the Tolerance of the Guppy to Beryllium Sulfate,
W74-06034 5C

Consumption of Water by the Cotton Plant at Different Concentrations of Soil Solution, (In Russian),
W74-06236 3C

SULFITE LIQUORS
Phenolic Compounds in Spent Pulping Liquors and Pulp Mill Effluents (Zwiazki fenolowe w lugach i sciekach z celulozowni),
W74-06400 5A

SULFITES
Succession in Benthic Macrofauna in a Swedish Fjord Subsequent to the Closure of a Sulphite Pulp Mill,
W74-06013 5C

SULPHUR BACTERIA
Attachment of Bacteria to Sulphur in Extreme Environments,
W74-06065 5B

SUNFISHES
Notes on the Upper Lethal Temperature of the Duskystripe Shiner, Notropis Pilsbryi, and the Bluegill, Lepomis macrochirus,
W74-06037 5C

Captain Toxicity to Fathead Minnows (Pimephales Promelas), Bluegills (Lepomis Macrochirus), and Brook Trout (Salvelinus Fontinalis),
W74-06085 5C

SURF
The Kinematics of Water Particle Velocities of Breaking Waves Within the Surf Zone,
W74-06314 2J

SURFACE-GROUNDWATER RELATIONSHIPS
An Analytical Interdisciplinary Evaluation of the Utilization of the Water Resources of the Rio Grande in New Mexico: Socorro Region,
W74-06103 6B

Observed Changes in Groundwater Regime Caused by the Creation of Lake Diefenbaker, Saskatchewan,
W74-06291 2F

Groundwater Management,
W74-06334 4B

SURFACE RUNOFF
Artificial Recharge of Groundwater by Local Surface Runoff (Iskusstvennoye vospolneniye zapasov podzemnykh vod za schet mestnogo poverkhnostnogo stoka),
W74-06450 4B

SUSPENDED SOLIDS
Mapping of Suspended-Sediment Discharge in Complex Atlases (Kartografirovaniye stoka vzveshennykh nanosov v kompleksnykh atlasakh),
W74-06452 2J

SUSQUEHANNA RIVER BASIN
Nutrient Enrichment and Control Requirements in the Upper Chesapeake Bay, Summary and Conclusions,
W74-06352 5C

SWAMPS
Drains and Ditches.
W74-06209 6E

SWAMPY LANDS
Draining and Reclamation of Swampy Forest Lands, (In Russian),
W74-06439 4A

SWASH AREAS
Epps v. Freeman (Action to Clear Title on Filled Swash Areas Between Property and the Sea).
W74-06324 6E

SWEDEN
Benthic Fauna and Zooplankton in Some Polluted Swedish Estuaries,
W74-06043 5C

Chemistry of Some Ground Waters in Igneous Rocks,
W74-06371 2K

The Content of Some Natural Radioactive Elements, Especially Rn-222, in Some Potable Waters in Sweden,
W74-06372 2K

The Water-Stages at the Coasts of Sweden, 1970.
W74-06373 2E

The PCB Story,
W74-06393 5A

SWEDEN (LAKE MALAREN)
Algal Assays of Archipelago Waters. Quantitative Aspects,
W74-06015 5C

Indications of Disturbances in the Nitrification Process in a Heavily Nitrogen-Polluted Water Body,
W74-06044 5C

SWEDEN (SALTKALLEFJORD)
Succession in Benthic Macrofauna in a Swedish Fjord Subsequent to the Closure of a Sulphite Pulp Mill,
W74-06013 5C

SWEDEN (STOCKHOLM ARCHIPELAGO)
Algal Assays of Archipelago Waters. Quantitative Aspects,
W74-06015 5C

SWEET-GUM SAPWOOD
Influence of Various Initial Moisture Contents on Decay of Sitka Spruce and Sweetgum Sapwood by Polyporus Versicolor in the Soil-Block Test,
W74-06487 2I

SWITZERLAND
Dewatering of Biological-Chemical Paper Mill Waste Water Sludge with the 'System Hiller' KHD Centrifuge (Entwaesserung von biologisch-chemischem Papierfabriksabwasser-Schlamm mit der KHD-Zentrifuge 'System Hiller'),
W74-06392 5D

SYNTHETIC RUBBER
Floating Sheets of Foam Rubber for Reducing Stock Tank Evaporation,
W74-06458 3B

Floating Sheets of Foam Rubber for Reducing Stock Tank Evaporation,
W74-06458 3B

SYSTEMATICS
The Biology of Mysids Acclimatized in the Reservoirs of the Volga River,
W74-06017 2H

Diversity and Longitudinal Zonation in Fish Populations of Two Streams Entering a Metropolitan Area,
W74-06055 2I

Inland Waters, Vol 16, Part 6. Freshwater Phytoplankton. Systematics and Biology, (In German),
W74-06235 2I

SYSTEMS ANALYSIS
Studies in the Analysis of Metropolitan Water Resource Systems, Volume VIII: Some Data and Methods for Analyzing Metropolitan Wastewater Reclamation and Reuse Systems,
W74-05951 5D

Biological Wastewater Treatment System Design. Part I. Optimal Synthesis,
W74-06407 5D

TAILWATER
Theoretical Irrigation Tailwater Volumes,
W74-06347 3F

TANNINS
The Determination of Tannin and Lignin,
W74-06163 5A

TAX RATE
Municipalities--Water Mains.
W74-06219 6E

TAX RATES
Applicability of Programming Models to Pricing and Risk Control in Water Resource Management,
W74-06104 6A

TELEMETRY
A Computer-Based Telecontrol and Communications System for a Water Supply Network,
W74-06146 7C

Automatic Collection and Transmission of Hydrological Observations.
W74-06287 7B

TEMPERATURE
Thermal Death of a Hydrocarbon Bacterium in a Nonaqueous Fluid,
W74-06098 5C

TEMPERATURE CONTROL
Programmable Temperature Controllers,
W74-06145 7C

TENNESSEE
Cambarus Buntingi, A New Species of Puncticambarus (Decapoda, Astacidae) from Kentucky and Tennessee,
W74-06056 2I

Drains and Ditches.
W74-06209 6E

Water Environmental Health Act.
W74-06210 6E

Solid Waste Disposal.
W74-06211 6E

TENNESSEE (OBEY RIVER)
Effects of Acid Mine Drainage on the Stream Ecosystem of the East Fork of the Obey River, Tennessee,
W74-06491 5C

TENSIOMETERS
Tensiometer Use in Shallow Ground-Water Studies,
W74-06343 4B

TERTIARY TREATMENT
Renovating Municipal Wastewater by High-Rate Infiltration for Ground-Water Recharge,
W74-06364 5D

TESTING PROCEDURES
Testing Digital Control Systems,
W74-06141 7B

Programmable Temperature Controllers,
W74-06145 7C

TETRASPORACEAE
Inland Waters, Vol 16, Part 6. Freshwater Phytoplankton. Systematics and Biology, (In German),
W74-06235 2I

TETRATHIONATE
Competitive Growth of Salmonella and Pseudomonads in Tetrathionate Enrichment Broth,
W74-06168 5C

TEXAS
Cibolo Project, Texas.
W74-06004 6E

Uptake and Accumulation of an Organochlorine Insecticide (Dieldrin) by an Estuarine Mollusc, Rangia Cuneata,
W74-06031 5C

Benthic Oxygen Demands of Houston Ship Channel Sediments,
W74-06073 5C

Index of Surface Water Stations in Texas, October 1973.
W74-06279 7C

Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Dallas, Texas Metropolitan Area, 1971,
W74-06288 2A

TFM
Acute Toxicities of Antimycin A, Bayer 73, and TFM to the Ostracod Cypretta Kawatai,
W74-06039 5C

THERMAL ACCLIMATION
Effect of DDT on Temperature Selection of Some Salmonids,
W74-06394 5C

THERMAL POLLUTION
Notes on the Upper Lethal Temperature of the Duskystripe Shiner, Notropis Pilsbryi, and the Bluegill, Lepomis macrochirus.
W74-06037 5C

Effects of Thermal Additions from the Yellowstone Geyser Basins on the Benthic Algae of the Firehole River,
W74-06046 5C

THERMAL STRESS
Thermal Death of a Hydrocarbon Bacterium in a Nonaqueous Fluid,
W74-06098 5C

The Biology of Gammarus (Crustacea, Amphipoda) in the Northwestern Atlantic, VII. The Duration of Embryonic Development in Five Species at Various Temperatures,
W74-06120 5C

THIN LAYER CHROMATOGRAPHY
Thin-Layer Chromatographic Analysis of HMX in Water,
W74-06033 5A

THIOCARBAMATE PESTICIDES
Determination of Residues of Mesurol and its Toxic Metabolites in Plant and Animal Tissues,
W74-06128 5A

THIRAM
Possible Microbial Contribution to Nitrosamine Formation in Sewage and Soil,
W74-06136 5B

THIRD PARTY EFFECTS
Oppen V. Aetna Insurance Co. (Action for Damages to Pleasure Boats Resulting from Oil Spill Disaster).
W74-06181 6E

THORIUM
The Residence Time of Thorium in Surface Sea Water and Its Implications Regarding the Rate of Reactive Pollutants,
W74-05995 5B

THUNDERSTORMS
Sensitivity Analysis of a Thunderstorm Rainfall Model,
W74-06101 2B

TIDAL ENERGY
The Search for Tomorrow's Power,
W74-06198 5G

TIDES
Preliminary Investigations of an Intertidal Sand Body, Cobequid Bay, Bay of Fundy,
W74-06260 2L

The Water-Stages at the Coasts of Sweden, 1970.
W74-06373 2E

Coastal Weather, Tides and Wind Waves of the Northern Gulf of Alaska,
W74-06431 2L

TILE DRAINS
Steady-State Patterns of Rainwater Seeping Through Bedded Soil With and Without Tile Drains,
W74-06257 2G

TOBACCO
Effect of Some Forms of Nitrogen Fertilizers on the Development and Chemical Composition of the Flue Cured Tobacco at Different Soil Moisture, (In Polish),
W74-06137 3F

TOPOGRAPHY
Climatic Profile of the North Chilean Desert at Latitude 20 Degrees South,
W74-06475 2B

TOXICITY
Mirex Incorporation in the Environment: Toxicity in Selected Freshwater Organisms,
W74-06032 5C

Effect of Water Hardness on the Tolerance of the Guppy to Beryllium Sulfate,
W74-06034 5C

The Acute Toxicity of Some Heavy Metal Ions toward Benthic Organisms,
W74-06035 5C

Prediction of Incipient Lethal Levels of Copper to Juvenile Atlantic Salmon in the Presence of Humic Acid by Cupric Electrode,
W74-06036 5C

Effect of Chelation on Toxicity of Copper,
W74-06048 5C

Crawling and Respiration as Indices of Sublethal Effects of Oil and A Dispersant on an Intertidal Snail Littorina Littorea,
W74-06084 5C

Physiological Response of the Mud Crab, Eurypanopeus Depressus to Cadmium,
W74-06126 5C

The Toxicity of Mixtures of Metals and Surfactants to Rainbow Trout (Salmo Gairdneri Rich.),
W74-06138 5C

Temperature and the Toxicity of Chromate and Arsenate to the Rotifer, Philodina Roseola,
W74-06172 5C

Apparatus for Control of Poison Concentration in Toxicity Studies with Fish,
W74-06174 5C

An Effective Method for the Isolation of Fish-Toxic Organic Solutes from Pulp Mill Effluents,
W74-06382 5D

TOXINS (FISH)
Hepatic Tumors in the Guppy (Lebistes reticulatus) Induced by Aflatoxin B1, Dimethylnitrosamine and 2-Acetylaminofluorene,
W74-06438 5C

TRACE ELEMENTS
Inorganic Reactions of Sewage Wastes with Soils,
W74-05973 5D

Trace Metals in Sediments of New York Bight,
W74-06012 5A

Algal Assays of Archipelago Waters. Quantitative Aspects,
W74-06015 5C

Trace Metals in Carbonate and Organic Rich Sediments,
W74-06050 5A

Trace Metal Water Pollutants Determined by X-ray fluorescence,
W74-06079 5A

Chemiluminescence Analysis for Trace Pollutants,
W74-06131 5A

The Determination of Trace Transition Elements in Biological Tissues Using Flameless Atom Reservoir Atomic Absorption,
W74-06132 5A

A Selective Microscale X-ray Fluorescence Analyzing Method for Determination of Trace Elements,
W74-06135 5A

Trace Metals Analysis on Small Oil Samples,
W74-06142 5A

Arsenic and Antimony in the Tropical Zone of the Atlantic Ocean (Mysh'yak i sur'ma v tropicheskoy zone Atlanticheskogo okeana),
W74-06309 2K

Chemical Pollution of Ground Waters,
W74-06365 5B

TRACE LEVELS
Chemiluminescence Analysis for Trace Pollutants,
W74-06131 5A

A Selective Microscale X-ray Fluorescence Analyzing Method for Determination of Trace Elements,
W74-06135 5A

Trace Metals Analysis on Small Oil Samples,
W74-06142 5A

TRACERS
The Residence Time of Thorium in Surface Sea Water and Its Implications Regarding the Rate of Reactive Pollutants,
W74-05995 5B

Detrital Quartz as a Natural Tracer-Fourier Grain Shape Analysis,
W74-06293 2J

TRANSPARENCY
Vertical Distribution of Transparency in Lake Baikal and its Relationship to Biological Indices, (In German),
W74-06237 2H

TRANSPIRATION
Dependence of Plant Thermoresistance on Thermodynamic Properties of Soil Moisture, (In Russian),
W74-06244 3F

Water Metabolism and Dynamics of Labeled Phosphorus in Apple Leaves, (In Russian),
W74-06245 3F

Simulation of Post-Irrigation Moisture Movement,
W74-06335 2G

TREATMENT FACILITIES
The Long Littered Path to Clean Air and Water,
W74-06234 5D

Nitrification and Denitrification Facilities,
W74-06274 5D

Bellmer Converging Double-Belt Press, An Interesting Machine for Sludge Dewatering (Die Bellmer-Winkelpresse, ein interessantes Geraet fuer die Schlammentwaesserung).
W74-06386 5D

Mine Water Purification by Reverse Osmosis,
W74-06409 5D

Submerged Turbine Aerators for Waste Water Treatment,
W74-06412 5D

Consolidated Installing One Waste Treatment Plant for Three Plants.
W74-06413 5D

TREES
Growth and Moisture Availability of Shelterbelts in the Kulunda Steppe (Rost i vlagoobespechennost' lesnykh polos v Kulundinskoy stepi),
W74-06301 2G

TRENCHES
Coastal Deserts of the Old World and Their Reclamation,
W74-06479 4A

TRICKLING FILTERS
Biological Wastewater Treatment System Design. Part I. Optimal Synthesis,
W74-06407 5D

Biological Wastewater Treatment System Design. Part II. Effects of Parameter Variations on Optimal Process System Structure and Design,
W74-06408 5D

TRINITY BAY (TEX)
Uptake and Accumulation of an Organochlorine Insecticide (Dieldrin) by an Estuarine Mollusc, Rangia Cuneata,
W74-06031 5C

TRITIUM
Bomb-Produced Tritium in the Antarctic Ocean,
W74-05993 5B

TROPHIC ANALYSIS
Tropic Analyses of an Estuarine Mangrove Community,
W74-06489 2L

TROPIC
Arsenic and Antimony in the Tropical Zone of the Atlantic Ocean (Mysh'yak i sur'ma v tropicheskoy zone Atlanticheskogo okeana),
W74-06309 2K

TROPICAL CYCLONES
A Blocked Minimal Tropical Depression Becomes a Storm of Rare Occurrence,
W74-06357 2B

TROUT
Effect of DDT on Temperature Selection of Some Salmonids,
W74-06394 5C

TSUNAMIS
Killer from the Bottom of the Sea,
W74-06286 4A

Numerical Simulation of Tsunamis,
W74-06297 4A

TUMORS (HEPATIC)
Hepatic Tumors in the Guppy (Lebistes reticulatus) Induced by Aflatoxin B1, Dimethylnitrosamine and 2-Acetylaminofluorene,
W74-06438 5C

TUNICATA (LARVAE)
Spawning, Larval Settlement, Growth, Biomass, and Distribution of Ciona intestinalis L. (Tunicata) in Borgenfjorden, North-Trondelag, Norway,
W74-06417 2L

TURBIDIMETERS
A Simple Turbidimeter for Rapid Determination of Low Bacteria Concentrations,
W74-06147 5A

TURBIDITY
Preliminary Design Criteria, Performance and Limitations of an Airborne Laser Bathymetric System,
W74-06296 7B

TURBINE AERATORS
Submerged Turbine Aerators for Waste Water Treatment,
W74-06412 5D

TURBINES
Submerged Turbine Aerators for Waste Water Treatment,
W74-06412 5D

TURTLES
Distribution of Dieldrin in the Turtle,
W74-06124 5A

ULTIMATE DISPOSAL
Solid Waste Disposal.
W74-06211 6E

UNITED KINGDOM
Water Usage in the British Paper and Board Industry,
W74-06383 5D

W74-06216 6E

Water Pollution Control and Public Water Supply.
W74-06227 6E

WATERSHEDS (BASINS)
Pending Watershed Projects.
W74-06196 6E

WAVE HEIGHT
Origin and Development of Beach Cusps at Monterey Bay, California,
W74-06313 2J

WAVE MEASUREMENTS
The Kinematics of Water Particle Velocities of Breaking Waves Within the Surf Zone,
W74-06314 2J

WAVES (WATER)
The Kinematics of Water Particle Velocities of Breaking Waves Within the Surf Zone,
W74-06314 2J

A Package Program for Time-Stepping Long Waves into Coastal Regions with Application to Haleiwa Harbor, Oahu,
W74-06316 2L

A New Method for Determining Normal Modes of Irregular Bodies of Water with Variable Depth,
W74-06318 2L

Speed of the Solitary Wave,
W74-06320 2J

Coastal Weather, Tides and Wind Waves of the Northern Gulf of Alaska,
W74-06431 2L

WEATHER DATA
Dendroclimatic History of Southwestern United States,
W74-06290 2B

Coastal Weather, Tides and Wind Waves of the Northern Gulf of Alaska,
W74-06431 2L

WEATHER MODIFICATION
Sixth Annual Survey Report on the Air Weather Service Weather Modification Program (FY 1973),
W74-06356 3B

Impacts of Induced Rainfall on the Great Plains of Montana.
W74-06442 3B

Ecological Impacts: Part 1--Range and Range Livestock production,
W74-06443 3B

Ecological Impacts: Part II--Wildlife and Biocommunities,
W74-06444 3B

Agricultural Impacts,
W74-06445 3B

Hydrology Impacts: Part I--Ground Water Hydrology,
W74-06446 3B

Hydrology: Part II--Surface Hydrology and Geomorphology,
W74-06447 3B

WEATHER PATTERNS
A Blocked Minimal Tropical Depression Becomes a Storm of Rare Occurrence,
W74-06357 2B

Economic Development of the Australian Coastal Deserts,
W74-06484 6B

WEATHERING
Chemistry of Some Ground Waters in Igneous Rocks,
W74-06371 2K

WELLS
Rhode Island Water Resources Board.
W74-06205 6E

WEST VIRGINIA
Natural Resources--Coal Refuse Disposal Control Act.
W74-06195 6E

Supervision over Local Sanitation.
W74-06218 6E

WETLANDS
Wetlands.
W74-06325 6E

Environmental Law--Zoning--Ordinance Prohibiting Filling Wetlands Adjacent to Navigable Waters Without Permit is Constitutional Exercise of Police Power Not Requiring Payment of Compensation.
W74-06331 6E

WETTING
Effects of a Wetting Agent on the Infiltration Characteristics of a Ponderosa Pine Soil,
W74-06456 2G

WHEAT
Productivity of Individual Varieties of Grain Cultures in Connection with Characteristics of Water Regime in Non-Irrigated Areas, (In Russian),
W74-06139 3F

Characteristic Changes in Water Forms in Cereal Type, Leaves Cultivated Without Irrigation, (In Azerbaijan),
W74-06233 3F

Dependence of Plant Thermoresistance on Thermodynamic Properties of Soil Moisture, (In Russian),
W74-06244 3F

Encouraging Residual Effect of Phosphorus on Wheat with One Irrigation,
W74-06496 3F

WHITE WATER (PAPER MACHINE)
Can Screened White Water be Recycled to Shower Felts,
W74-06384 5D

WHITEFISH
New Complexities in Zoogeography and Taxonomy of the Pygmy Whitefish (Prosopium coulteri),
W74-06498 2H

WILDLIFE
International Cooperative Study of Organochlorine and Mercury Residues in Wildlife, 1969-71,
W74-06053 5A

A Bill to Amend the Fish and Wildlife Coordination Act, and for Other Purposes.
W74-06176 6E

Powers and Duties of Department of Fish and Wildlife.
W74-06184 6E

Ecological Impacts: Part II--Wildlife and Biocommunities,
W74-06444 3B

WILDLIFE CONSERVATION
A Bill to Amend the Fish and Wildlife Coordination Act, and for Other Purposes.
W74-06176 6E

WILDLIFE HABITATS
A Bill to Amend the Fish and Wildlife Coordination Act, and for Other Purposes.
W74-06176 6E

WINDS
On the Causes of Aridity Along a Selected Group of Coasts,
W74-06469 2B

WINTER FLOUNDER
Effects of Egg Concentrations of DDT and Dieldrin on Development in Winter Flounder (Pseudopleuronectes Americanus),
W74-06091 5C

WIRE SPEED INDICATORS
A Portable Wire-Speed Indicator for Use with Plankton Nets,
W74-06059 7B

WISCONSIN
Multivariate Approaches to Algal Stratagems and Tactics in Systems Analysis of Phytoplankton,
W74-06047 5C

Beach Foreshore Sedimentology and Morphology in the Apostle Islands of Northern Wisconsin,
W74-06281 2J

Environmental Law--Zoning--Ordinance Prohibiting Filling Wetlands Adjacent to Navigable Waters Without Permit is Constitutional Exercise of Police Power Not Requiring Payment of Compensation.
W74-06331 6E

Consolidated Installing One Waste Treatment Plant for Three Plants.
W74-06413 5D

WITHDRAWAL
A Multilayer Aquifer Model of the Ogallala Formation in Oklahoma.
W74-05962 2F

Hydrology of Basalt Aquifers and Depletion of Ground Water in East-Central Washington.
W74-06311 2F

WOOD WASTES
Process for Recovering Forest Product Plant Wastes,
W74-06378 5D

Utilization of Bark Waste,
W74-06379 5A

WYOMING
Effects of Thermal Additions from the Yellowstone Geyser Basins on the Benthic Algae of the Firehole River,
W74-06046 5C

Summary of Water-Level and Pumpage Data in the Cheyenne and Federal Municipal Well Fields, April 1, 1972 to April 2, 1973, Cheyenne, Wyoming,
W74-06369 4B

Soil Moisture Response to Spraying Big Sagebrush the Year of Treatment,
W74-06462 2I

Water Harvesting Efficiencies of Four Soil Surface Treatments,
W74-06463 3B

WYOMING (YELLOWSTONE NATIONAL PARK)
Emission Spectrometric Determination of Arsenic,
W74-06499 5A

X-RAY ANALYSIS
Mycological Applications of X-Ray Microanalysis,
W74-06096 5A

X-RAY DIFFRACTION
Determination of Montmorillonite in Small Samples and Implications for Suspended-Matter Studies,
W74-06285 2J

X-RAY FLUORESCENCE
Trace Metal Water Pollutants Determined by X-ray fluorescence,
W74-06079 5A

A Selective Microscale X-ray Fluorescence Analyzing Method for Determination of Trace Elements,
W74-06135 5A

YABUCOA VALLEY (PR)
Electrical Analog Model Study of the Alluvial Aquifer in the Yabucoa Valley, Puerto Rico: Phase 2--The Planning, Construction and Use of the Model,
W74-06351 2F

YAKIMA RIVER (WASH)
Water Quality Report--Yakima River, December 1970--September 1971,
W74-06261 5B

YUGOSLAVIA (BOSNIA-HERZEGOVINA)
Comparison of the Epizootological Importance of the Parasites of Salmo Gairdneri Irideus in the Two Coast Areas of Bosnia and Herzegovina,
W74-06254 5C

ZETA POTENTIAL
The Standard Potential of the Single-Crystal Copper Electrode in Aqueous Solutions,
W74-06149 2K

ZINC
Prediction of Incipient Lethal Levels of Copper to Juvenile Atlantic Salmon in the Presence of Humic Acid by Cupric Electrode,
W74-06036 5C

Solvent Extraction of Copper (II) and Zinc (II) with 1,5-Diphenylcarbazone,
W74-06088 5A

ZONING
Environmental Law--Zoning--Ordinance Prohibiting Filling Wetlands Adjacent to Navigable Waters Without Permit is Constitutional Exercise of Police Power Not Requiring Payment of Compensation.
W74-06331 6E

Water Zoning: The Management of Surface Activity on Lakes, Streams, Rivers and Bays,
W74-06377 6B

ZOOPLANKTON
Benthic Fauna and Zooplankton in Some Polluted Swedish Estuaries,
W74-06043 5C

Can Halobates Dodge Nets. I: By Daylight.,
W74-06117 2I

Can Halobates Dodge Nets. II: By Moonlight.,
W74-06118 2I

Population Dynamics of Pond Zooplankton. II. Daphnia Ambigua Scourfield,
W74-06154 5C

Preliminary Results of Studies About the Plankton of the 'Laguna Setubal' (Santa Fe, Argentina), (In Spanish).
W74-06238 2H

W74-06261 5B

Water Quality Report, Upper Snoqualmie River System, August 1972-November 1972,
W74-06375 5B

WASHINGTON STATE DEPT. OF ECOLOGY, OLYMPIA. DIV. OF ENVIRONMENTAL MONITORING.
Water Quality Report--Stillaguamish River, December 1970-September 1971,
W74-06273 5B

WASHINGTON STATE DEPT. OF ECOLOGY, OLYMPIA. OFFICE OF TECHNICAL SERVICES.
Investigations--Geology and Groundwater Resources, Vicinity of Castle Rock, Cowlitz County, Washington,
W74-06278 4B

Investigations--Ground Water Conditions in the Vicinity of Plaza, Spokane County, Washington,
W74-06436 4B

WASHINGTON STATE UNIV., PULLMAN. COLL. OF ENGINEERING.
Geophysical Investigations of Washington's Ground Water Resources,
W74-06262 2F

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF POLITICAL SCIENCE.
The Columbia Interstate Compact: Politics of Water Resources in the Pacific Northwest,
W74-05957 6E

WASHINGTON UNIV., SEATTLE. DEPT. OF CIVIL ENGINEERING.
Enriching Effects of Urban Runoff on the Productivity of a Mesotrophic Lake,
W74-06080 5C

WATER POLLUTION RESEARCH LAB., STEVENAGE (ENGLAND).
Apparatus for Control of Poison Concentration in Toxicity Studies with Fish,
W74-06174 5C

WATER RESOURCES BOARD, READING (ENGLAND).
The Hydrological Evaluation of Regional Water-Resource Systems in the United Kingdom,
W74-06421 6B

WELSBACH OZONE SYSTEMS CORP., PHILADELPHIA, PA.
Ozone Disinfection of Industrial-Municipal Secondary Effluents,
W74-06159 5D

WESTCHESTER COMMUNITY COLL., VALHALLA, N.Y. DEPT. OF CHEMISTRY.
Trace Metals in Sediments of New York Bight,
W74-06012 5A

WESTERN AUSTRALIA UNIV., NEDLANDS.
Economic Development of the Australian Coastal Deserts,
W74-06484 6B

WESTERN FOREST PRODUCTS LAB., VANCOUVER (BRITISH COLUMBIA).
An Effective Method for the Isolation of Fish-Toxic Organic Solutes from Pulp Mill Effluents,
W74-06382 5D

WILLIAMS AND WORKS, GRAND RAPIDS, MICH.
Recycling Municipal Sludges and Effluents on Land,
W74-05982 5D

WISCONSIN COOPERATIVE FISHERY UNIT, STEVENS POINT.
Influence of Appearance of Prey and Satiation of Predator on Food Selection by Northern Pike (Essox lucius),
W74-06102 8I

WISCONSIN UNIV., MADISON. DEPT. OF BACTERIOLOGY.
Effects of Thermal Additions from the Yellowstone Geyser Basins on the Benthic Algae of the Firehole River,
W74-06046 5C

WISCONSIN UNIV., MADISON. DEPT. OF BOTANY.
Multivariate Approaches to Algal Stratagems and Tactics in Systems Analysis of Phytoplankton,
W74-06047 5C

WISCONSIN UNIV., MADISON. DEPT. OF SOIL SCIENCE.
Nitrogen and Phosphorus Release from Decaying Water Milfoil,
W74-06018 5C

WISCONSIN UNIV., MADISON. INST. FOR ENVIRONMENTAL STUDIES.
On Multidisciplinary Research on the Application of Remote Sensing to Water Resources Problems,
W74-05988 7B

WISCONSIN UNIV., MILWAUKEE. DEPT. OF GEOGRAPHY.
On the Causes of Aridity Along a Selected Group of Coasts,
W74-06469 2B

New Evidence on the Climatic Controls Along the Peruvian Coasts,
W74-06471 6B

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS.
Determination of Montmorillonite in Small Samples and Implications for Suspended-Matter Studies,
W74-06285 2J

WORLD METEOROLOGICAL ORGANIZATION, GENEVA(SWITZERLAND).
Automatic Collection and Transmission of Hydrological Observations.
W74-06287 7B

Snow Surveys from Earth Satellites--A Technical Review of Methods.
W74-06295 7B

Standardization in Hydrology and Related Fields.
W74-06298 7C

WUERZBURG UNIV. (WEST GERMANY). BOTANISCHES INSTITUT II.
Stomatal Responses to Changes in Humidity in Plants Growing in the Desert,
W74-06241 2I

YALE UNIV., NEW HAVEN, CONN. BECTON CENTER.
A High Speed Microprogrammed System for Generation and Acquisition of Signals,
W74-06021 7B

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.

Subject Fields

- NATURE OF WATER
- WATER CYCLE
- WATER SUPPLY AUGMENTATION AND CONSERVATION
- WATER QUANTITY MANAGEMENT AND CONTROL
- WATER QUALITY MANAGEMENT AND PROTECTION
- WATER RESOURCES PLANNING
- RESOURCES DATA
- ENGINEERING WORKS
- MANPOWER, GRANTS, AND FACILITIES
- SCIENTIFIC AND TECHNICAL INFORMATION

INDEXES

- SUBJECT INDEX
- AUTHOR INDEX
- ORGANIZATIONAL INDEX
- ACCESSION NUMBER INDEX
